THE SPARCS DATA SYSTEM

OVERVIEW

BACKGROUND

The Statewide Planning and Research Cooperative System (SPARCS) was implemented by the New York State Department of Health in 1979, with the cooperation and initial financial support of the U.S. Department of Health and Human Services. SPARCS receives, processes, stores and analyzes inpatient data from all general hospitals in New York State. It serves as a comprehensive and integrated information network that supports and links the functions of health care resource planning, financing and surveillance of hospital services in New York State.

While meeting the informational needs of the Department of Health, SPARCS has also proven an effective management tool for the health care industry. Widespread support and advice from many organizations and individuals within the public and private sectors has been most beneficial in the development and refinement of SPARCS. The Department of Health continues to invite such active participation and assistance with the aim of improving the quality and usefulness of SPARCS.

The *1983 Annual Report Series* represents SPARCS' fourth full year of data collection efforts. The report series presents hospital stay data through a set of standard statistical tables determined to be of value to a wide spectrum of health information users. The tables are also available on a Health Systems Area, county and hospital specific basis, and may be requested through the use of the order form in the back of this report series.

DATA SOURCES

SPARCS was designed to make use of existing data sources to the greatest extent possible to minimize duplicative reporting requirements for New York hospitals. SPARCS collects data from two sources: the Discharge Data Abstract (DDA) and the Uniform Billing Form (UBF).

The data set defined for the DDA for SPARCS is based on the Uniform Hospital Discharge Data Set, developed by the National Committee on Vital and Health Statistics. For speed and efficiency, hospitals submit discharge data on computer tapes rather than on paper forms. Data elements collected by SPARCS are listed in Appendix A.

The Uniform Billing Form, used as the uniform claim form for all third-party payors in New York State, also serves as a reporting document for SPARCS. (See Appendix B for uniform bill data elements collected by SPARCS and a copy of the UBF-1-81 form). SPARCS data are generally extracted from the UBF after payment is made to the hospital to take advantage of the edits, corrections and computer tape transfers carried out by the various third-party payors.

DATA PROTECTION

Regulations governing the confidentiality of SPARCS data were adopted by the New York State Hospital Review and Planning Council with the advice of all sectors of the health care industry. The regulatory functions of SPARCS are administered by the Department of Health to ensure stringent control over the confidentiality of SPARCS data.

To protect patient privacy, patient names are omitted from the SPARCS data set for both the DDA and the UBF. As a result, SPARCS cannot track patients across time; the system tracks incidence of disease or condition, rather than prevalence. For this reason, users of SPARCS data cannot ascertain the number of individuals *per se* treated for specific diseases, but only the number of patient incidents that have occurred.

The privacy regulations define the major purposes for which SPARCS data may be used: financial studies, rate setting, facility surveillance, health planning and resource allocation studies, epidemiology, research studies and hospital monitoring of its own data.

A Data Protection Review Board (DPRB) is responsible for approving all requests for deniable data. The SPARCS Privacy Regulation defines as deniable data certain data elements which by themselves or in combination with other elements might lead to the disclosure of a patient's identity. (See Appendix C for a description of the board's functions and current membership.)

The Department of Health also is advised by the Council on Hospital Information Policy (CHIP) on hospital data collection needs. This council focuses on the general data needs and data systems of New York's hospital industry. (See Appendix D for a description of the council's functions and membership.)

USES OF SPARCS DATA

The largest segment of SPARCS users consists of hospitals requesting their own data and management consultants acting on behalf of their client hospitals. The second most frequent user of SPARCS data is the New York State Department of Health.

All requests for SPARCS data must be submitted to the Department of Health's SPARCS Bureau. When such requests are approved for production, the SPARCS Bureau provides a cost estimate based on availability of existing reports and the cost of analysis, programming and computer time. The requestor must agree, prior to the processing of the request, to pay the actual costs for report production (not to exceed the estimate).

DATA COLLECTION PROCESS

DISCHARGE ABSTRACT COLLECTION NETWORK

The hospitals' medical record departments submit selected data which are transferred to a uniform, computer-readable format on magnetic tape in one of two ways: either directly to SPARCS or through a private information processing service.

All DDAs received by SPARCS are validated to identify critical and noncritical SPARCS errors. A critical data element is one that must have a valid value before a record is accepted by the system. The data collector is notified when a DDA needs correction. DDAs are carefully screened for duplicate submissions.

Each method of discharge data submission is producing timely and accurate information for incorporation into the SPARCS data base.

UNIFORM BILL COLLECTION NETWORK

When a UBF is completed for an inpatient discharge, the hospitals' billing departments distribute copies of the form to the appropriate third-party payor or payors. Uniform bill data collection for SPARCS is accomplished by a network of data collectors that process the required bill information on magnetic tape.

SPARCS data are gathered after Medicare, Medicaid and Blue Cross claims are processed, thereby enabling SPARCS to take advantage of the existing edits used by these payors. For all other types of claims, hospitals are required to submit a copy of the UBF to their regional SPARCS Data Collection Center at the time the claim is submitted.

The DDA and the UBF have a number of common elements that enable matching of records concerning patient stays. By linking these records, a merged file containing both financial and summary medical abstract information for all inpatient hospitalizations is created. The file may then be compared to or matched with data from the Institutional Cost Report (ICR).

CONSTRAINTS ON DATA APPLICATIONS

Data are included for all patients discharged in 1983 even if they were admitted in 1982 or earlier. Data for patients entering a hospital in 1983 but discharged in 1984 are not included. SPARCS arrives at a patient-day count for each discharge record by subtracting the date of admission from the date of discharge. If patients are admitted and discharged the same day, their length of stay is one day.

In contrast to the DDA data, which is submitted to SPARCS shortly after a patient's hospital discharge, the bulk of the UBF data is obtained only after payment has been made to the provider. Although this "post-payment" submission of billing data has many benefits, some problems do occur when there is a long delay between the hospitals' submission of bills and receipt of data by SPARCS. Questions concerning a patient's eligibility or the coordination of benefits may account for these delays.

It is important to note that, regardless of the length of a patient's hospital stay, the DDA is completed only once by the hospital. Hospital billing cycles, however, vary among hospitals. Many hospitals process bills monthly; therefore, the submission of a UBF does not always represent a discharge. When patient claims involve more than one payor, SPARCS must consolidate records for multiple payors. This is a complex process, fully successful only after all of a patient's component bills are received and properly validated.

These have proven difficult problems to solve due to the large number of records processed by SPARCS. However, major progress has been made on the processing and matching of 1983 billing data. A matched master file of 1983 DDA and UBF data is now available. The SPARCS Bureau is beginning analysis of this matched file and will be considering the publication of a supplementary volume of the *1983 Annual Report Series* which would display these data.

DESCRIPTION AND PRESENTATION OF SELECTED 1983 STATISTICS

1983 ARS TABLE REVISIONS

The continued efforts of the SPARCS Bureau to refine and improve usefulness of hospital data has resulted in several changes to the *1983 Annual Report Series.*

One of the major changes involves the expansion of the currently available data by the addition of five new tables. Table 10 has been expanded to include a new table (10B) that displays the number of discharges and average length of stay data by service category and day of admission. Table 15 categorizes the number of discharges by service category, hospital and patient county of origin. Table 16 demonstrates patient migration patterns by displaying the number of discharges and the number of patient days by HSA of patient origin and HSA of hospitalization. Table 17 exhibits the number of discharges and average length of stay data by age, sex, county and hospital. Finally, Table 18 contains the number of discharges and average length of stay data by age, sex and patient county of origin.

In addition, there have been modifications to some of the existing tables. Table 1 added two additional items describing the number of discharges, patient days and average length of stay data for discharges with alternate level of care status. Item 10 lists the service categories for these discharges and Item 11 describes the type of alternate level of care required.

Tables 7 and 12 utilize the Major Diagnostic Categories (MDCs) from the new Diagnosis Related Group (DRG) scheme, which is described below (see Appendix G for a description of each MDC).

In the *1980, 1981* and *1982 Annual Report Series*, Table 9 reports the number of discharges by patient disposition and age. The *1983 Annual Report Series* expands this table by adding a detailed breakdown by age and sex.

Other modifications to age categories and patient county of origin are described below.

AGE OF PATIENT

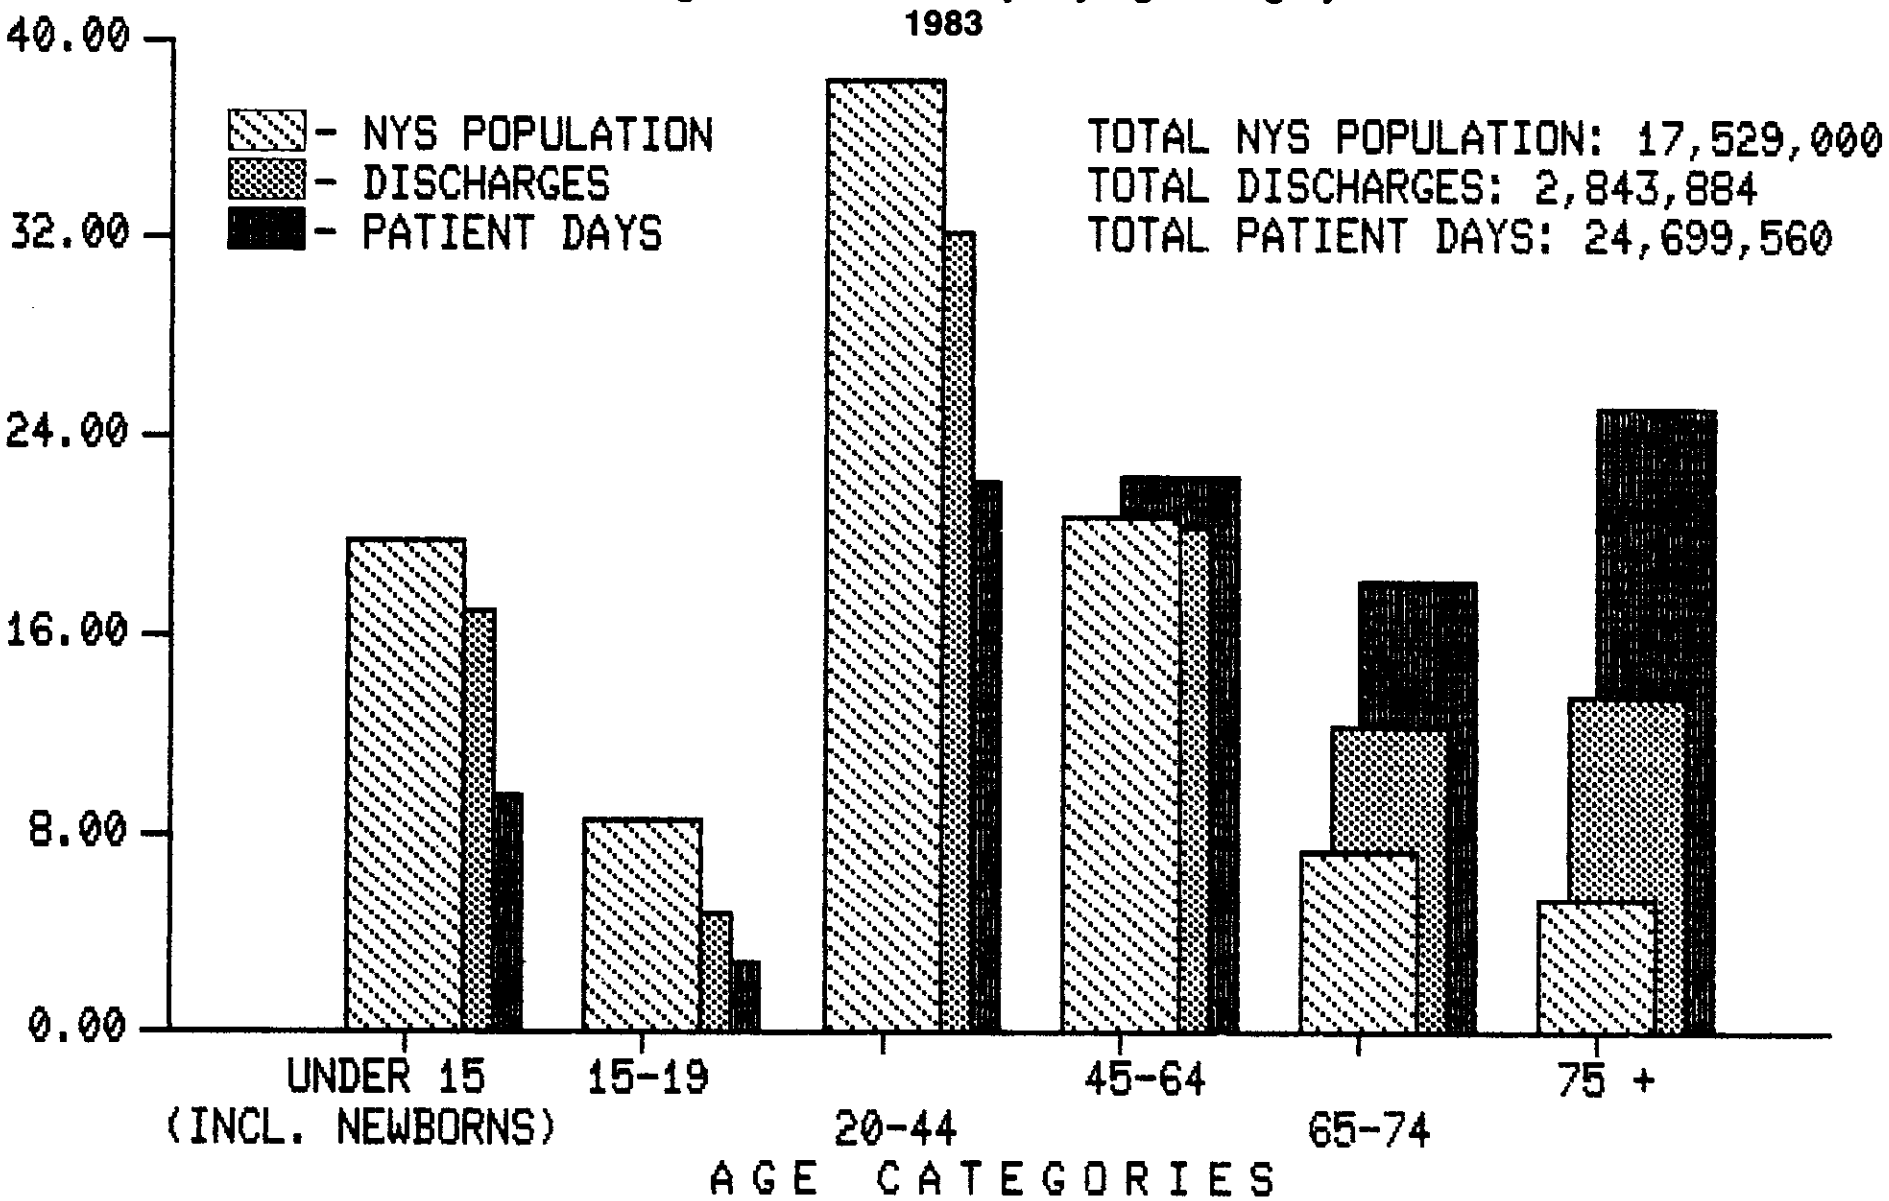
The age categories used in this *1983 Annual Report Series* are newborn[1], 0-5 (excluding newborns), 6-14, 15-19, 20-44, 45-64, 65-74, 75-84 and 85 years and older. In previous *Annual Report Series*, the oldest age range reported was 75 years and older. For purposes of graphic display, the newborn, 0-5 and 6-14 age categories have been combined, as well as the 75-84 and the 85 and over categories.

Figure A illustrates the generally known fact that as people get older they are more likely to use hospital services, and that their average length of stay tends to increase as well. The 15-19 year old group, which comprised 8.5 percent of the state's population, accounted for only 4.8 percent of all discharges and 2.8 percent of all patient days in 1983.

This figure also shows that people 75 years of age and older made up 5.3 percent of the state's population, but accounted for 13.5 percent of all discharges and 25.1 percent of all patient days.

[1]*The newborn (or nursery) category refers only to live-born infants whose principal ICD-9-CM diagnosis code is V30.0, V30.1, V31.0, V31.1, V32.0, V32.1, V33.0, V33.1, V34.0, V34.1, V35.0, V35.1, V36.0, V36.1, V37.0 or V37.1.*

FIGURE A
Percentage of New York State Population
Discharges and Patient Days by Age Category
1983



SEX OF PATIENT

In 1983, 1,179,198 males and 1,664,686 females were discharged from general hospitals in New York State. Males represented 41.5 percent of discharges, females 58.5 percent.

Figure B shows the average length of stay and ratio of discharges per 1,000 residents for the total state population and for males and females. The 1983 population data are based on estimates provided by the New York State Department of Health's Bureau of Health Statistics. While the state population statistics include only residents, SPARCS data include both resident and nonresident patients in New York State hospitals.

FIGURE B
New York State Average Length of Stay Data and Number of Discharges Per 1,000 Population By Sex of Patient
1983

	Average Length of Stay	Discharges Per 1,000 Population
Both Sexes	8.7 days	162.2
Male	9.1 days	142.1
Female	8.4 days	180.3
Female excluding Abortions and Obstetrical Services	9.7 days	141.2

The average length of stay for all patients was 8.7 days. The average length of stay was 9.1 days for males and 8.4 days for females. If hospital discharges for principal diagnoses involving abortions and obstetrical services are discounted, the average length of stay for females in 1983 was 9.7 days. Figure B also shows that both females and males had approximately the same probability of being hospitalized. The adjusted ratio of discharges per 1,000 females in 1983 was 141.2 compared to 142.1 per 1,000 males.

EXPECTED PRIMARY SOURCE OF REIMBURSEMENT

The expected primary source of reimbursement used in the *Annual Report Series* was obtained from the DDA file. This data element is documented at the time of discharge, not the time of payment, and is the best information available to a hospital's medical records department when a patient leaves the facility. Given the complexity of reimbursement methodologies, especially when a patient appears to be eligible under more than one third-party payment plan, the expected primary payor cannot be considered a completely reliable component of this report series. There may be a bias toward underreporting of discharges for programs where there are delays in the establishment of eligibility.

Additionally, this report series has a major coding problem that could not be corrected before the tables were printed. Approximately 900 discharges from one hospital were incorrectly coded as Workers Compensation cases. This miscoding should be taken into consideration when using Expected Primary Source of Reimbursement data from this year's tables. It is expected that these data will be revised shortly. Individuals requiring corrected data should contact the SPARCS Bureau.

DISCHARGES

Statewide statistics indicate that government-sponsored health care programs and private health insurance played approximately equal roles as the primary payors for hospital stays in 1983. Government sponsored programs were reported as the primary payors for 45.4 percent of all discharges. Private health

insurance plans (Blue Cross, commercial insurance and Workers' Compensation) were reported as the primary payors for 45.9 percent of hospital discharges occurring in 1983.

There are wide regional differences with regard to payor distribution. In New York City, government-sponsored programs were the primary payors for over half the hospital stays (51.6 percent), while private insurance was the major payor for 36.6 percent of all cases. These proportions are reversed in the rest of the state, with government programs primarily paying for 40.7 percent of hospital discharges and private insurance reimbursing hospitals for 53.1 percent of discharges.

PATIENT DAYS

Government-sponsored programs were the primary payors for hospital stays representing more than half of all patient days in both New York City and the rest of the state. Care should be exercised in interpreting tabulations of patient days by expected primary source of reimbursement. For each discharge, a single payor is reported as the *expected* primary source of reimbursement. Since many cases have multiple payors, the expected primary payor may not pay the entire bill. For example, Figure D shows that discharges for which Medicare was the expected primary payor accounted for 45.3 percent of all patient days. That does *not* mean that Medicare paid for 45.3 percent of the patient days.

Table 1 shows that statewide, government programs were the expected primary source of reimbursement for hospital stays involving three-fifths (61.6 percent) of all patient days, while private insurance was the expected primary source of reimbursement for hospital stays involving approximately one-third (31.7 percent) of 1983 patient days. In New York City, government programs were the expected primary payment source for hospital stays involving almost two-thirds (64.2 percent) of patient days in general care hospitals, while private insurance was the expected primary payment source for hospital stays involving 26.4 percent of patient days. In the rest of the state, government programs were the expected payment source for hospital stays involving 59.3 percent of patient days, while private insurance was the expected primary payment source for hospital stays involving 36.5 percent. Figures C and D show the proportions of discharges and patient days associated with the four largest expected payor categories: Medicare, Medicaid, Blue Cross and commercial. A detailed listing of expected primary source of reimbursement appears in Table 1.

SERVICE CATEGORIES

The service categories used in the *Annual Report Series* are based on categories developed by the New York State Department of Health and used by the former New York State Health Planning Commission. The categories are defined in terms of the *International Classification of Diseases, 9th Revision, Clinical Modification* (ICD-9-CM) diagnosis codes. The SPARCS service categories are tabulated only by principal diagnosis, as reported on the DDA.

NURSERY—The patient's age is equal to zero with an ICD-9-CM code: V30.0, V30.1, V31.0, V31.1, V32.0, V32.1, V33.0, V33.1, V34.0, V34.1, V35.0, V35.1, V36.0, V36.1, V37.0 or V37.1. These codes refer only to live-born infants. The definitions of the nursery service category and the newborn age category are the same.

OBSTETRICAL—All ages, ICD-9-CM codes 630 through 634.9 and 640 through 676.9.

PSYCHIATRIC—All ages, ICD-9-CM codes 290 through 319.

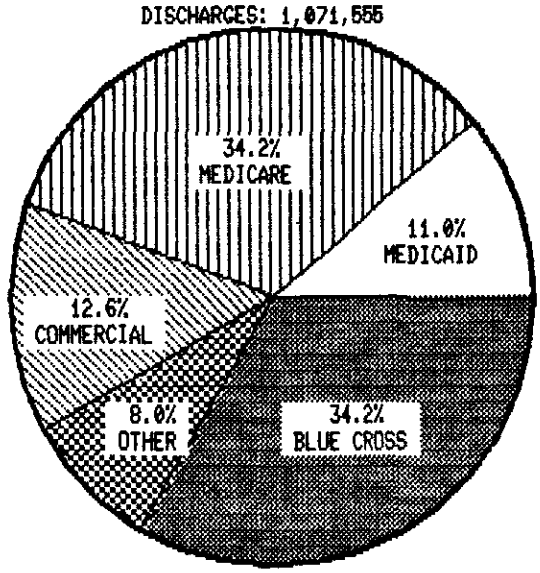
PEDIATRIC—All patients, age 14 years and younger, whose principal diagnosis is neither included in the newborn, obstetrical or psychiatric categories defined above nor classified by ICD-9-CM codes 614 through 629.9 (gynecological) or 635 through 639.9 (abortion).

MEDICAL—All patients, age 15 years or older, with no reported procedure code or all reported procedure codes greater than 86.99. This category also includes gynecological patients (ICD-9-CM codes 614 through 629.9) of all ages with no reported procedure code or all reported procedure codes greater than 86.99. Excluded are newborn, obstetrical, psychiatric and pediatric patients as defined above.

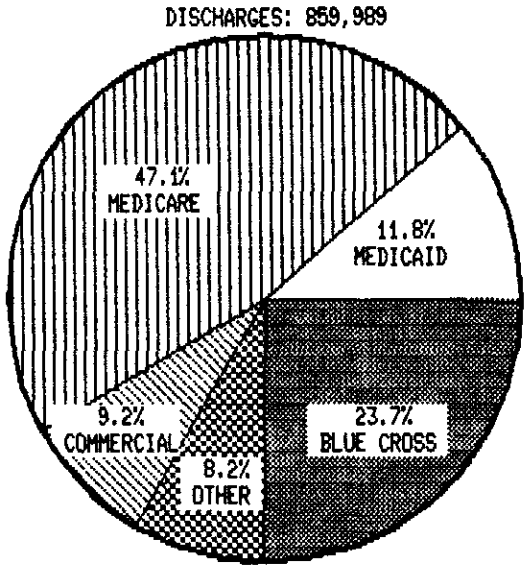
SURGICAL—Patients age 15 years or older with at least one procedure code in the range 01 through 86.99. This category also includes gynecological patients (ICD-9-CM codes 614 through 629.9) of all ages with at least one such procedure code, and all patients whose principal diagnosis is listed as 635—639.9 (abortion). Excluded are newborns, obstetrical, psychiatric, pediatric and medical patients as defined above.

FIGURE E
Percentage of Discharges by Expected Primary Source of Reimbursement and Service Category 1983

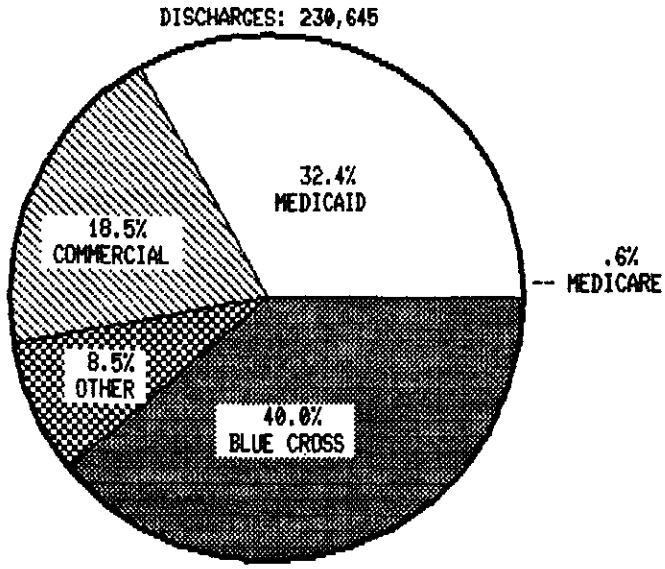
These charts display the major expected primary source of reimbursement categories as functions of the six service categories used in this publication.



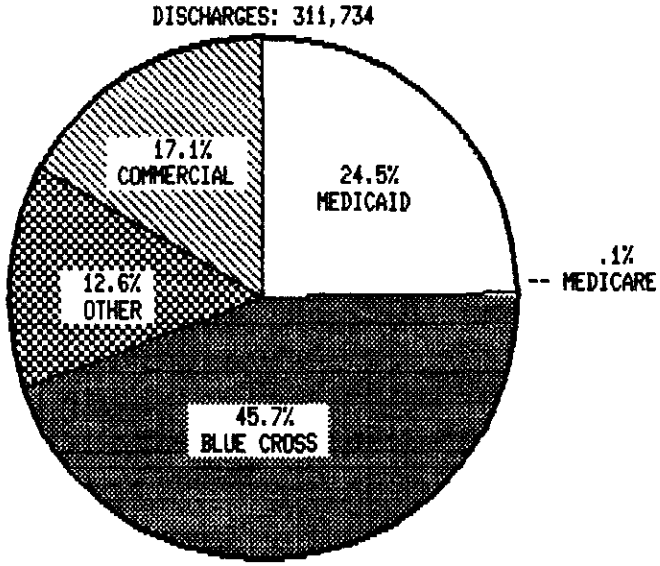
SURGICAL



MEDICAL

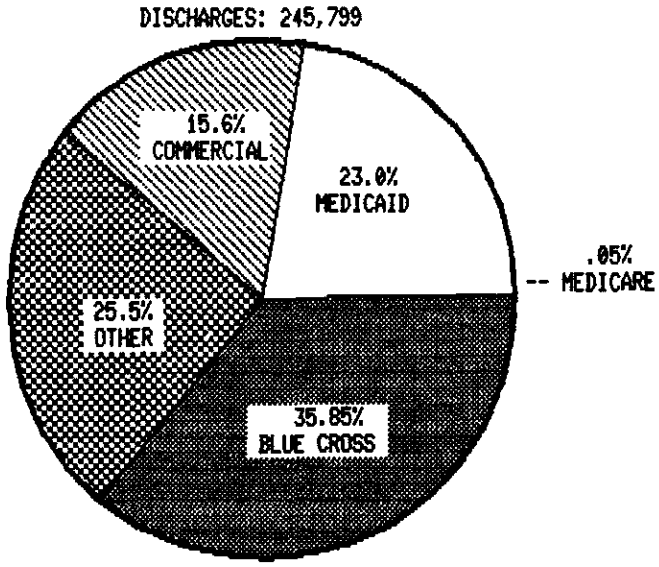


PEDIATRIC

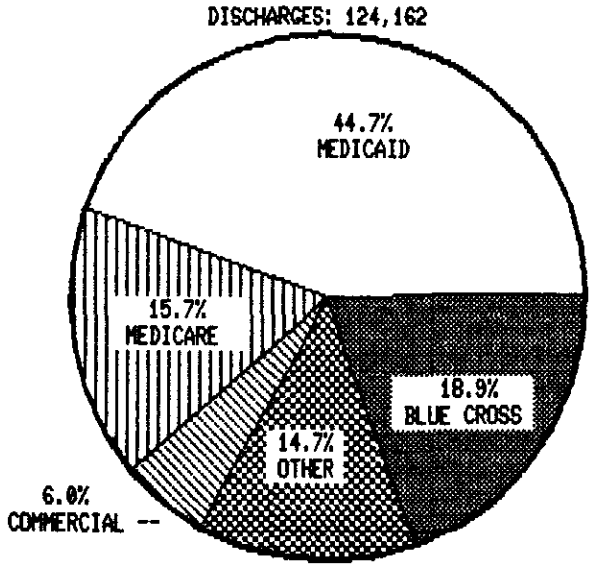


OBSTETRIC

Private payors (Blue Cross and commercial insurance) were the expected primary payors for more than half of the reported discharges in the pediatric, obstetric and nursery service categories. Medicare and Medicaid combined were the expected primary payors for over half of the reported discharges in the medical and psychiatric service categories. SPARCS data indicate that in New York State there is a significant relationship between the type of service rendered and the expected primary source of reimbursement.



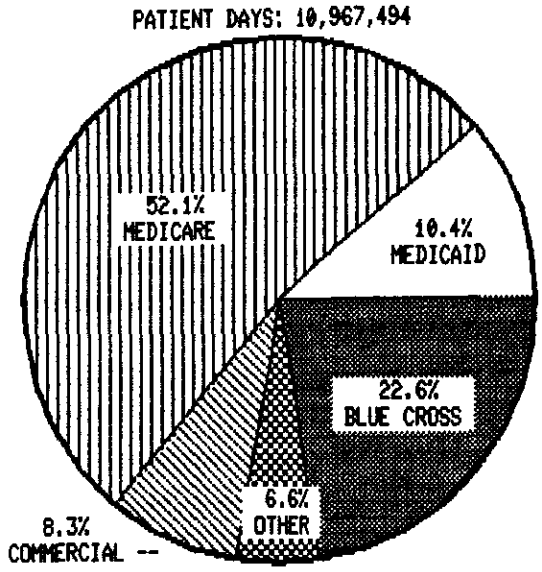
NURSERY



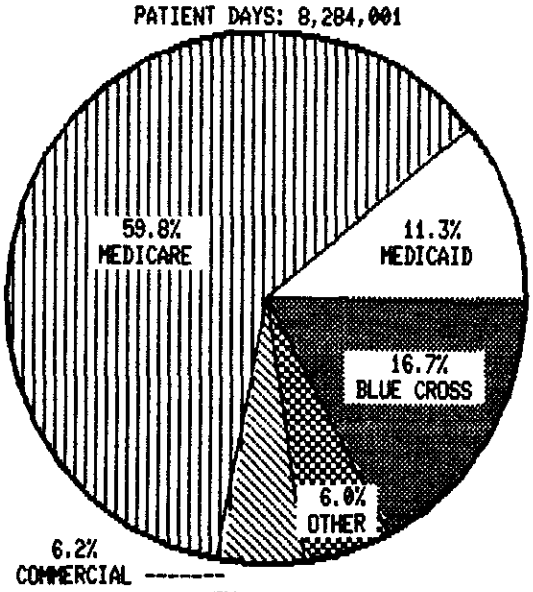
PSYCHIATRIC

FIGURE F
Percentage of Patient Days by Expected Primary Source of Reimbursement and Service Category 1983

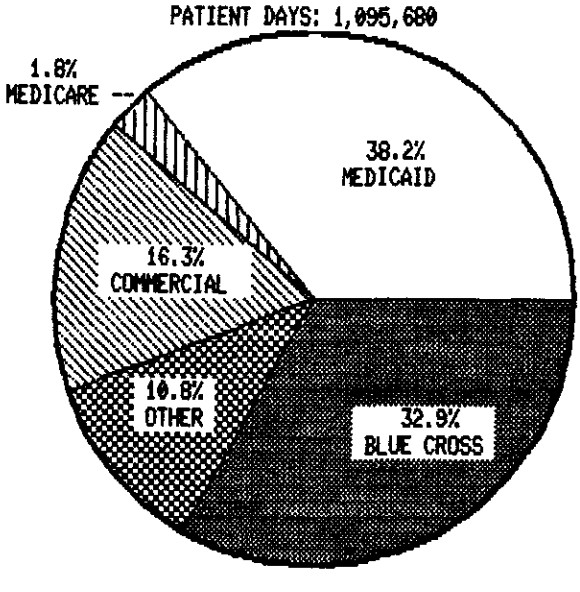
These charts display the major expected primary source of reimbursement categories as functions of the six service categories used in this publication.



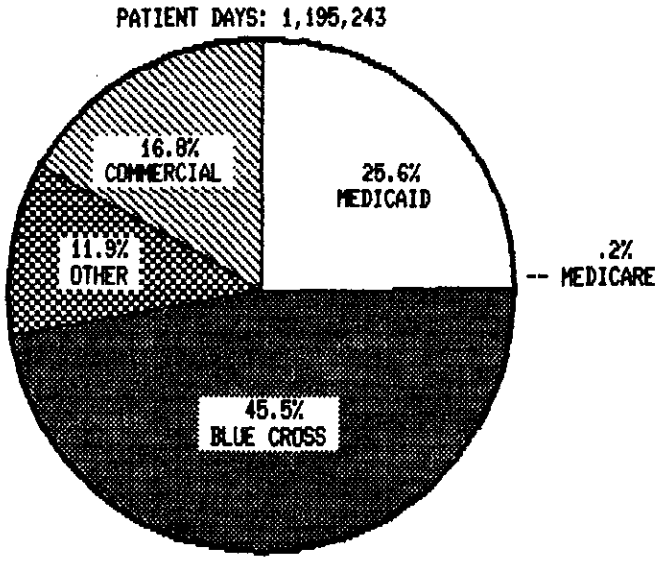
SURGICAL



MEDICAL

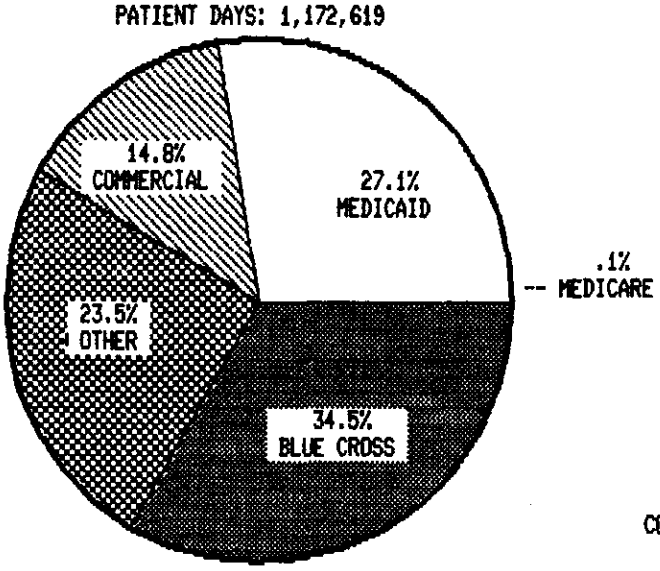


PEDIATRIC

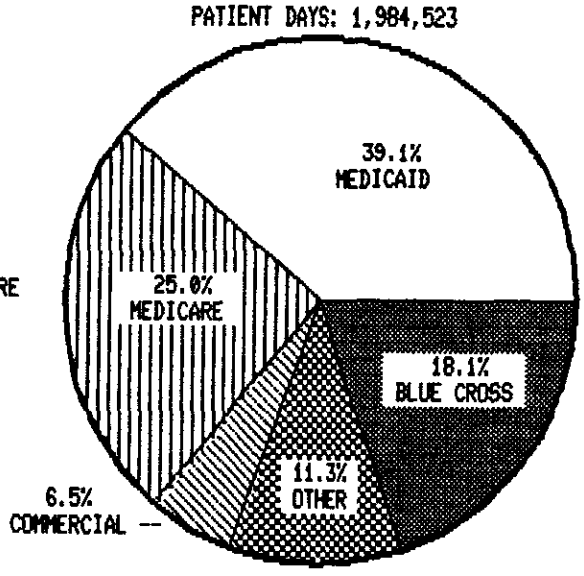


OBSTETRIC

As in the similar distribution of discharges (Figure E), Blue Cross and commercial insurance were the expected primary sources of reimbursement for hospital stays involving more than half of the patient days in the obstetric and nursery service categories. These same two payor groups were the expected primary payors for hospital stays involving slightly less than half of the patient days in the pediatric service category. Medicare alone was the expected primary source of reimbursement for hospital stays involving the majority of the patient days in the medical and surgical service categories. Medicare and Medicaid combined were the expected primary sources of reimbursement for hospital stays involving the majority of the patient days in the psychiatric service category.



NURSERY



PSYCHIATRIC

DIAGNOSIS RELATED GROUPS

Diagnosis Related Groups (DRGs) are a classification system used to categorize patient abstracts into meaningful groupings. In previous *Annual Report Series* (1980-1982) the original DRG model of 383 DRGs arrayed within 83 Major Diagnostic Categories (MDCs) was reported. This report series uses the "new" or "federal" DRG model which consists of 470 DRGs arrayed within 24 Major Diagnostic Categories (including a residual category).

The "new" DRG model was developed to make use directly of the diagnoses and procedures as coded according to the ICD-9-CM. The previous DRG model required the conversion of ICD-9-CM coding into an earlier coding system before the assignment of DRGs. The development of the "new" model led to a different emphasis based on the direct correlation that was identified between organ systems and the consumption of hospital resources.

The "new" DRG model begins the classification process by categorizing all principal diagnoses into 23 mutually exclusive and exhaustive MDCs based on certain predetermined criteria. The criteria used to assign an abstract to a DRG include principal diagnosis, secondary diagnoses, operating room procedures, presence of a substantial comorbidity and/or complication, age and discharge status. An additional category labelled "MDC 24" has been developed in order to classify cases in DRG 468 (operating procedures unrelated to diagnosis), DRG 469 (valid diagnosis unacceptable as principal diagnosis) and DRG 470 (discharge with invalid data).

Figure G illustrates the method of assigning an abstract to one of the eight DRGs within MDC 16: Diseases and Disorders of the Blood and Blood-Forming Organs and Immunity.

Figure H compares the rate of hospitalization for males and females within the 24 MDCs. The most common MDC among females was "pregnancy, childbirth and the puerperium."

Of the conditions not related to obstetrical services, "diseases of the circulatory system" were the most frequently occurring conditions requiring hospitalization for both males and females. In 1983, there were 159,958 males and 149,245 females admitted for diagnoses included in this MDC.

RESIDENT HOSPITALIZATION RATES BY COUNTY

In Table 14 of the *1980, 1981* and *1982 Annual Report Series*, the patient's county of origin was based on the zip code submitted for the patient's principal residence. For 1983 data, the patient's county of origin is based on the county code submitted to the SPARCS Bureau on the DDA. Tables 14, 15, 16 and 18 are derived from county codes rather than zip codes.

Table 14 lists each county, its rate of hospitalization per 1,000 residents and the hospitals most frequently used by patients from each county. The 1983 county population data used in this report series are estimates provided by the New York State Department of Health's Bureau of Health Statistics.

The state average discharge rate per 1,000 population is 157.0 while the patient day rate is 1,363.6 patient days per 1,000 residents.

Figures I and J illustrate the relative hospitalization and patient day rates by county. Figure K illustrates the average length of stay data by county of patient origin. Residents of Tioga County were the least likely to be hospitalized in 1983, with a rate of 112.1 discharges per 1,000 residents; the rate for Montgomery County was the highest in the state with 228.0 discharges per 1,000 residents. Tioga County experienced the state's lowest patient day rate in 1983, with 766.5 patient days per 1,000 residents, while Montgomery County's rate of 1,960.5 patient days per 1,000 residents was the state's highest.

New York State residents treated in out-of-state hospitals are not reported to SPARCS. An assumption can be made that hospitalization rates for counties where patients routinely travel to out-of-state facilities for health care would be higher if data from out-of-state hospitals were available. Out-of-state residents treated in New York hospitals are not included in Tables 14, 15 and 18.

Figure L illustrates the relative hospitalization and patient day rates by health service area (HSA) for 1982 and 1983. While residents in HSA 1 (Western New York) represented the largest discharge rate with 177.0 discharges per 1,000 residents in 1983, residents in HSA 7 (New York City) had the largest patient day rate with 1,551.1 patient days per 1,000 population. Those who resided in HSA 8 (Nassau-Suffolk) were the least likely to be hospitalized with a rate of 140.2 discharges per 1,000 residents hospitalized. These same residents were also representative of the smallest patient day rate in 1983 with 1,144.5 patient days per 1,000 residents. In 1982, residents in HSA 1 also represented the highest discharge rates, and residents in HSA 7 represented the highest patient day rate.

Figures M and N compare the resident inpatient hospitalization rates and the resident patient day rates respectively for New York State, New York City and New York State excluding New York City.

Data collected by SPARCS should not, in itself, be used to draw conclusions about the overall health of residents. The availability of health care outside hospitals, the average length of stay for patients hospitalized in a county or HSA and socioeconomic characteristics should be taken into account when comparing the hospitalization rates of different areas of the state.

	Resident Patient Days	Rate Per 1,000 Population
New York State	23,903,255	1363.6
New York City	11,008,504	1551.1
New York State excluding New York City	12,894,751	1236.1

ALTERNATE LEVEL OF CARE

Table 1 contains new data indicating the number of discharges with alternate level of care days and the type of care required. In this table the discharges are defined as those with one or more days of alternate level of care. Patient days include both acute and alternate level of care days.

Surgical discharges with alternate level of care days had the highest average length of stay (70.0 days) while obstetrics had the lowest (9.3 days). The type of alternate level of care most frequently required was a skilled nursing facility.

Due to data collection problems, this report series does not separate alternate level of care days from acute care days. Future refinements to the system will improve the accuracy of these data and enable us to include them in the *1984 Annual Report Series*.

1980/1981/1982/1983 COMPARATIVE STATISTICS

COMPARISON OF DISCHARGES AND PATIENT DAYS BY AGE, SERVICE CATEGORY AND EXPECTED PRIMARY SOURCE OF REIMBURSEMENT

Statewide comparative statistics for 1981, 1982 and 1983 confirm the discharge and patient day stability of the inpatient hospital population. Figures P, Q and R display the comparisons.

COMPARISON OF NEW YORK STATE HOSPITALIZATION RATES PER 1,000 POPULATION 1980/1981/1982/1983

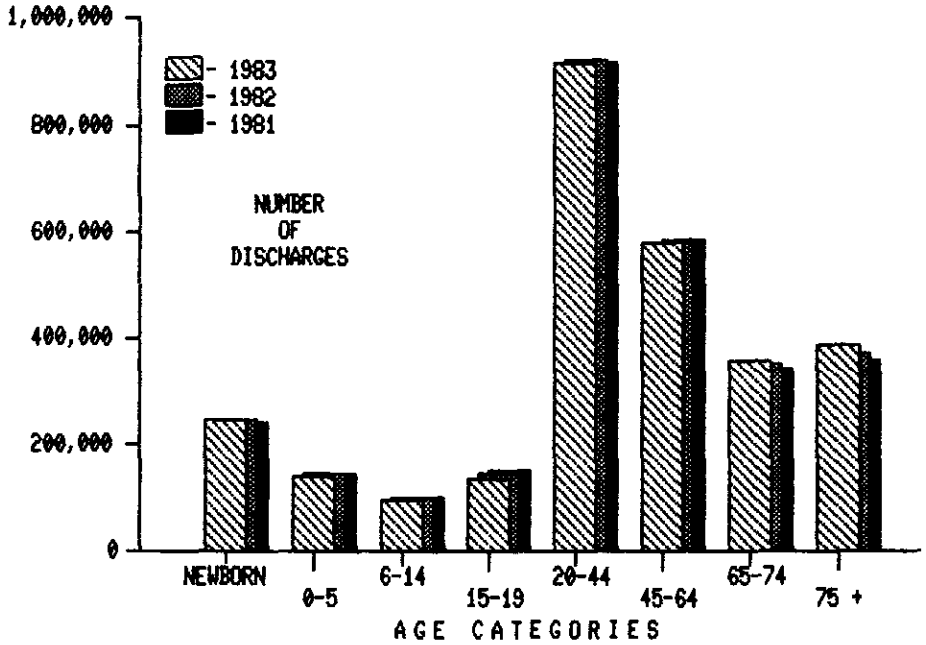
The 1980, 1981, 1982 and 1983 resident hospitalization rates per 1,000 population are similar for New York State, New York City and New York State excluding New York City. Figure O compares these rates for 1980, 1981, 1982 and 1983.

There were 2,644,613 New York State resident discharges reported to SPARCS in 1980, 2,682,409 in 1981, 2,720,372 in 1982 and 2,751,586 in 1983. While Figure O shows a trend from 1980 to 1982 of slightly increasing hospitalization rates, it is probable that these increases are a reflection of improved SPARCS reporting. However, our analyses of 1982 and 1983 data indicate that SPARCS is nearing the goal of complete reporting from all hospitals. Therefore, comparison of the rates for future years with the 1982 and 1983 rates should allow determination of the existence of trends for the hospitalization rates of New York State residents.

FIGURE O
New York State Resident Hospitalization
Rates Per 1,000 Population for 1980, 1981, 1982 and 1983

	1980	1981	1982	1983
New York State	150.6	153.3	155.8	157.0
New York City	152.2	157.7	161.6	163.0
New York State excluding New York City	149.6	150.3	152.0	152.8

FIGURE P
Number of Discharges and Patient Days by Age for 1981, 1982 and 1983



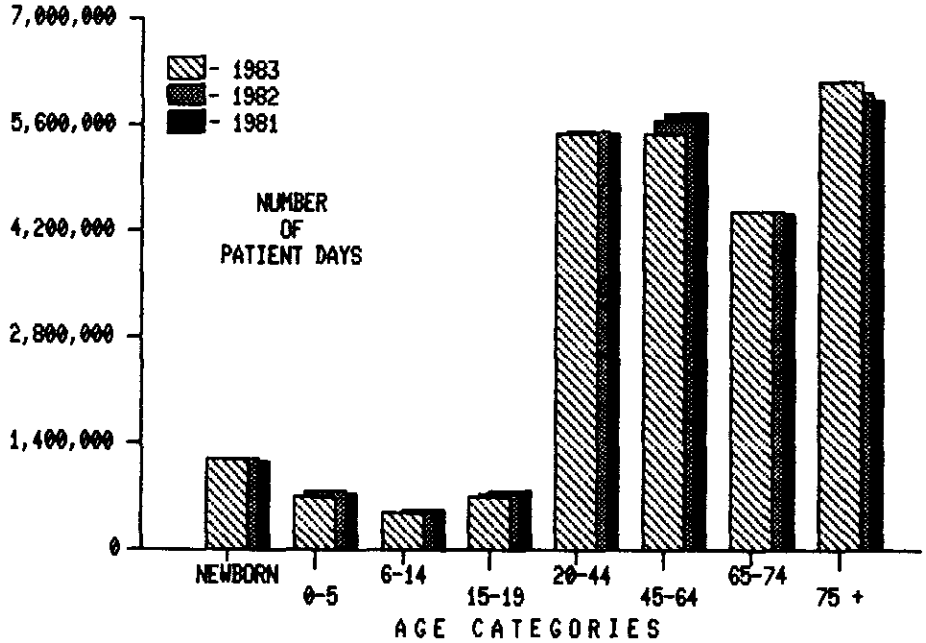


FIGURE Q
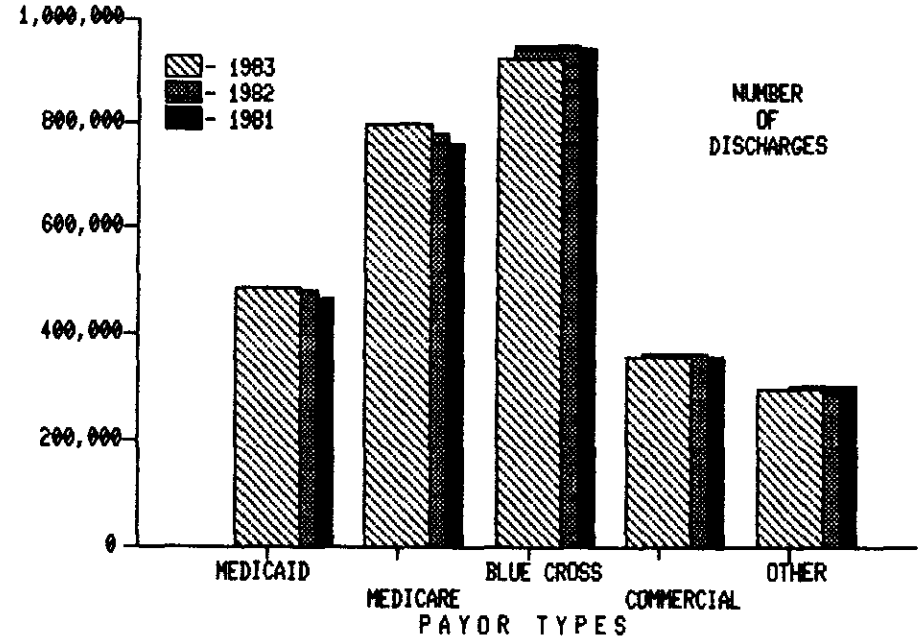
Number of Discharges and Patient Days by Expected Primary Source of Reimbursement for 1981, 1982 and 1983



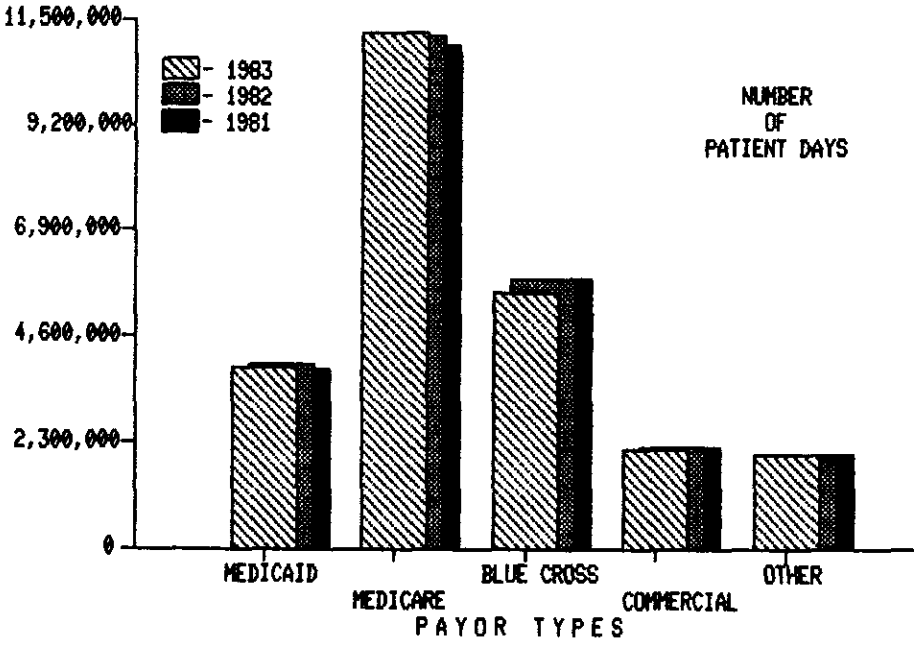


FIGURE R
Number of Discharges and Patient Days by Service Category for 1981, 1982 and 1983

APPENDIX C

DATA PROTECTION REVIEW BOARD

The Data Protection Review Board (DPRB) was established by regulation to review all requests for deniable data.

For the release of deniable data to be approved, the request must be technically feasible and a majority of the DPRB must be satisfied that the purpose of the request is legitimate, the applicant is qualified, the applicant needs the data to conduct the proposed study and adequate safeguards exist to protect patient privacy.

The board makes recommendations to the Commissioner of Health on the release of information. While the commissioner may reverse the decision of the board, the board retains the authority to overturn the commissioner's decision by a two-thirds vote of the entire board. This system of checks and balances protects the rights of individuals while providing access to needed information.

COUNCIL ON HOSPITAL INFORMATION POLICY

The Council on Hospital Information Policy (CHIP) was established by regulation to provide advice and assistance to the Department of Health on matters relating to the collection and dissemination of hospital data. CHIP advises the Commissioner of Health on the data needs of New York's hospital industry.

The scope of CHIP's authority includes review of policy regarding:

- the establishment of new hospital data collection systems, including the formulation of regulations governing these systems, and the development of efficient data collection methodologies;
- the maintenance and/or modification of SPARCS;
- the preparation of reports that address the common information requirements of data users.

SPARCS STANDARD TABLE PRICES FOR 1983

The following statistical tables are available by health service area, county and hospital from the SPARCS Bureau:

TABLE 1 — Fee: $3.00 per report

Summary of hospital stay data showing number of discharges, patient days and average length of stay data by age, sex, service category, expected primary source of reimbursement, admission status, disposition of patient, month of discharge, day of admission, service categories for discharges requiring alternate level of care and type of alternate level of care required (three pages per report)

TABLE 2 — Available in the *Annual Report Series* only, Fee: $13.00

Hospital statistical profiles displaying discharges, patient days and average length of stay data by service category for each health service area, county and hospital

TABLE 3 — Fee: $4.00 per report

Number of discharges, patient days and average length of stay data by service category, sex and age (three pages per report)

TABLE 4 — Fee: $4.00 per report

Number of discharges, patient days and average length of stay data by service category and expected primary source of reimbursement (three pages per report)

TABLE 5 — Fee: $4.00 per report

Number of discharges, patient days and average length of stay data by expected primary source of reimbursement, sex and age (three pages per report)

TABLE 6 — Available in the *Annual Report Series* only, Fee: $13.00

Number of discharges, patient days and average length of stay data by expected primary source of reimbursement, county and hospital

TABLE 7 — Fee: $40.00 per report

Number of discharges and average length of stay data by age, sex, and major diagnostic category (two pages per report)

TABLE 8 — Fee: $2.00 per report

Number of discharges by admission status, patient disposition and service category (one page per report)

TABLE 9 — Fee: $2.00 per report

Number of discharges by patient disposition, sex and age (two pages per report)

TABLE 10 — Fee: $12.00 per report

Number of discharges and average length of stay data by service category, month and day of admission (two pages per report)

TABLE 11 — Fee: $40.00 per report

Note: This table may only be requested in conjunction with Table 13

Number of discharges by the fifty most common principal diagnoses and surgical procedure category (three pages per report)

TABLE 12 — Fee: $40.00 per report

Number of discharges by expected primary source of reimbursement and major diagnostic category (six pages per report)

TABLE 13 — Fee: $40.00 per report

Note: This table may only be requested in conjunction with Table 11

Number of discharges by expected primary source of reimbursement and surgical procedure category (12 pages per report)

TABLE 14 — Available in the *Annual Report Series* only, Fee: $13.00

Patient Origin Profile: Number of discharges and patient days by service category, patient county of origin and hospital

TABLE 15A — Available in the *Annual Report Series* only, Fee: $13.00

Patient origin profile: Number of discharges by service category, hospital and patient county of origin
