The New York State Department of Health (NYSDOH) collects, compiles, and analyzes information on influenza activity year round in New York State (NYS) and produces this weekly report during the influenza season (October through the following May).

During the week ending February 29, 2020

- Influenza activity level was categorized as geographically widespread. This is the 14th consecutive week that widespread activity has been reported.
- There were 8,459 laboratory-confirmed influenza reports, a 20% decrease over last week.
- Of the 2,927 specimens submitted by WHO/NREVSS clinical laboratories, 702 (23.98%) were positive. 482 were influenza A (97 H1, 26 H3 and 359 subtyping not performed) and 220 were influenza B.
- Of the 88 specimens resulted at Wadsworth Center, 67 were positive for influenza. 37 were influenza A (H1), 4 were influenza A (H3), 1 was influenza A (not subtyped), 1 was influenza B (Yamagata) and 24 were influenza B (Victoria).
- Reports of percent of patient visits for influenza-like illness (ILI) from ILINet providers was 3.75%, above the regional baseline of 3.20%.
- The number of patients hospitalized with laboratory-confirmed influenza was 1,236, a 17% decrease over last week.
- There were no influenza-associated pediatric deaths reported this week. There have been 9 influenza-associated pediatric deaths reported this season.

Laboratory Reports of Influenza (including NYC)

Influenza activity for the week ending February 29, 2020

Calculated based on reports of lab-confirmed influenza cases per 100,000 population to the NYSDOH.

- 62 counties reported cases this week.
- Incidence ranged from 7.72-807.58 cases/100,000 population.
Laboratory Reports of Influenza (Including NYC)

Test results may identify influenza Type A, influenza Type B, or influenza without specifying Type A or B. Some tests only give a positive or negative result and cannot identify influenza type (not specified).

World Health Organization (WHO) and National Respiratory & Enteric Virus Surveillance System (NREVSS) Collaborating Laboratories

Clinical laboratories that are WHO and/or NREVSS collaborating laboratories for virologic surveillance report weekly the number of respiratory specimens tested and the number positive for influenza types A and B to CDC. Because denominator data is provided, the weekly percentage of specimens testing positive for influenza is calculated.

Public health laboratories that are WHO and/or NREVSS collaborating laboratories also report the influenza A subtype (H1 or H3) and influenza B lineage (Victoria or Yamagata).

Influenza Virus Types and Subtypes Identified at Wadsworth Center (excluding NYC)

Wadsworth Center, the NYSDOH public health laboratory, tests specimens from sources including, outpatient healthcare providers (ILINet) and hospitals (FluSurv-NET). There are 2 common subtypes of influenza A viruses – H1 and H3. Wadsworth also identifies the lineage of influenza B specimens Yamagata or Victoria. Rarely, an influenza virus is unable to have it’s subtype or lineage identified by the laboratory. Wadsworth sends a subset of positive influenza specimens to the CDC for further virus testing and characterization.
Emergency Department Visits for ILI Syndromic Surveillance (excluding NYC)

Hospitals around NYS report the number of patients seen in their emergency departments with complaints of ILI. This is called syndromic surveillance.

An increase in visits to hospital emergency departments for ILI can be one sign that influenza has arrived in that part of NYS.

Syndromic surveillance does not reveal the actual cause of illness, but is thought to correlate with emergency department visits for influenza.

Outpatient Influenza-like Illness Surveillance Network (ILINet) (excluding NYC)

The NYSDOH works with ILINet healthcare providers who report the total number of patients seen and the total number of those with complaints of influenza-like illness (ILI) every week in an outpatient setting.

The CDC uses trends from past years to determine a regional baseline rate of doctors’ office visits for ILI. For NYS, the regional baseline is currently 3.10%. Numbers above this regional baseline suggest high levels of illness consistent with influenza in the state.

Note that surrounding holiday weeks, it is not uncommon to notice a fluctuation in the ILI rate. This is a result of the different pattern of patient visits for non-urgent needs.

Additional information regarding national antiviral resistance testing, as well as recommendations for antiviral treatment and chemoprophylaxis of influenza virus infection, can be found at http://www.cdc.gov/flu/weekly/.

NYS Antiviral Resistance Testing Results on Samples Collected Season-to-date, 2019-20

i. Majority of samples tested by pyrosequencing for the H275Y variant in the neuraminidase gene (NA) which confers resistance to oseltamivir. A subset tested by Whole Genome Next Generation Sequencing (WG-NGS) for other variants known to cause, or suspected of causing, resistance to antivirals.

ii. Majority of samples tested by pyrosequencing for variants at codons E119, R29K, and N294 in the NA. A subset tested by WG-NGS for other variants known to cause, or suspected of causing, resistance to antivirals.

iii. Majority of samples tested by pyrosequencing for variants at codons D197, and I221 in the NA. A subset tested by WG-NGS for other variants known to cause, or suspected of causing, resistance to antivirals.
Patients Hospitalized with Laboratory-Confirmed Influenza (including NYC)

Hospitals in NYS and NYC report the number of hospitalized patients with laboratory-confirmed Influenza to NYSDOH. 170 (93%) of 182 hospitals reported this week.

Influenza Hospitalization Surveillance Network (FluSurv-NET)

As part of the CDC's FluSurv-NET, the NYS Emerging Infections Program (EIP) conducts enhanced surveillance for hospitalized cases of laboratory-confirmed influenza among residents of 15 counties. Underlying health conditions are assessed through medical chart reviews for cases identified during the season.

FluSurv-Net estimated hospitalization rates will be updated weekly starting later this season.

Note:
5 Counties include, in the Capital District: Albany, Columbia, Greene, Montgomery, Rensselaer, Saratoga, Schenectady, and Schoharie; in the Western Region: Genesee, Livingston, Monroe, Ontario, Orleans, Wayne, and Yates
6 Data are based on medical record reviews for 776 of 2425 hospitalized cases currently under investigation and should be considered preliminary.
Healthcare-associated Influenza Activity (including NYC)

Hospitals and nursing homes in NYS report outbreaks of influenza to the State. An outbreak in these settings is defined as one or more healthcare facility-associated case(s) of confirmed influenza in a patient or resident or two or more cases of influenza-like illness among healthcare workers and patients/residents of a facility on the same unit within 7 days. Outbreaks are considered confirmed only with positive laboratory testing.?

Pediatric influenza-associated deaths reported (Including NYC)

Local health departments report pediatric influenza-associated deaths to NYSDOH.

Flu-associated deaths in children younger than 18 years old are nationally notifiable. Influenza-associated deaths in persons 18 years and older are not notifiable.

All pediatric flu-associated deaths included in this report are laboratory-confirmed.
