MRT Evaluation Methods/Results

- 68 proposals submitted

- Survey and data collection tool disseminated to 22 reviewers to evaluate proposals
  - Characteristics
    - Cost
    - Quality
    - Disparities Impact
    - Overall
  - Scale from -1 to 3

- 15 surveys received

- Analyze results for each of the above characteristics for each proposal:
  - Minimum and Maximum scores received
  - Average score: Sum of all scores divided by the total responses
  - Median score: The score in the middle of all scores when ordered numerically
  - Mode: The most frequently reported score
  - Variance: Measures how far the scores are spread out from each other

- In addition to standard additional analytic methods for the above:
  - Exclude missing responses from the analysis
  - Questions 7&8 are two parts of the same question. Respondents asked to enter score in question 7.
    - If no response in question 7, use response in question 8.
    - If responses in both question 7&8, select the highest score
  - Variance categorization is determined based on the range of all calculated range

- Order proposals within each characteristic by highest average score

- Identify the top 10 proposals for each characteristic
