

ASCVD risk calculator integration in the EHR?

For the Cardiovascular Disease Project, it would be helpful to have the Atherosclerotic Cardiovascular Risk Calculator (American Heart Association) integrated into the EHR to improve physician and clinical team adoption and use to assess a person's 10 year risk of Atherosclerotic Cardiovascular Disease. This 10 year risk evaluation would benefit the physician to explore if their patient should be on Asprin medication for Primary Prevention and if they should talk to their patient about using Statins for cholesterol management. Are there any PPS's who are having discussions with their physician groups/ or EMR vendors about integrating the ASCVD risk calculator and capturing the 10 year risk score in a structured format for reporting? Here's something that could increase adoption of an evidence based standard of care!
