Intro to Refresher Program

2001 EMT-Paramedic: National Standard Curriculum Refresher Course
This is the 2001 EMT-Paramedic: National Standard Curriculum Refresher Course. This course is intended for the EMS community to use to refresh their current Paramedic providers who have been educated to the 1998 EMT- Intermediate level. This course is not intended to transition current 1985 Paramedics to the revised 1998 level. The course was developed by the National Association of EMS Educators (NAEMSE).
2001 EMT-Paramedic: NSC Refresher Curriculum

    Appendix B – Practice Scenario and Scenario Template
    Appendix C – Practical Evaluation Skill Sheets
INTRODUCTION

HISTORY AND DEVELOPMENT PHILOSOPHY

As part of the revision project for the EMT-Intermediate and EMT-Paramedic: National Standard Curricula (NSC), the contractor was directed to develop the *EMT-Paramedic and EMT-Intermediate Continuing Education, National Guidelines*. The guidelines document, developed as a substitute for traditional refresher courses, gives the reader an overview of competency assurance mechanisms to promote the delivery of medically appropriate patient care. The guidelines document defined refresher programs as follows:

Refresher programs are a review of the original program in a condensed number of hours. While ideal for the purpose of remediation, they are not intended to expand the cognitive or psychomotor ability above the entry level. Therefore, refresher courses should not be considered a means of continued expansion of cognitive information and introduction of new psychomotor skills. They are not intended to deliver relevant contemporary information to practitioners who are currently active in the field.

Although the guidelines document is widely used by the EMS community, the definition for refresher programs caused the EMS community to ask that refresher courses be developed. A contract to develop the refresher courses went to the National Association of EMS Educators (NAEMSE) and they convened a task force of EMS stakeholders inclusive of regulators, physicians, association representatives, providers, and educators.

Some challenges undertaken by the task force were:

1. The development of a refresher program based on scientific data.
2. A program that could be delivered in different formats.
3. A program flexible enough to meet the specific needs of different systems while maintaining the intent of a refresher program.
4. The need to incorporate relevant contemporary material.

The task force used EMS provider practice data, an EMS literature review, expert opinion, and a final EMS community review to develop the refresher programs. Previous versions of EMS refresher programs have been based on a perceived need and not on scientific evidence. With this in mind, the Refresher Development Task Force relied heavily on the findings of the 1999 *NREMT Practice Analysis* and the following documents:

- *The EMS Agenda for the Future*
- *The EMS Education Agenda for the Future, A Systems Approach*
- *The National EMS Education and Practice Blueprint*
- *EMT-Paramedic and EMT-Intermediate Continuing Education, National Guidelines*
- *1999 EMT-Intermediate National Standard Curriculum*
Each of the above documents was created as individual projects, but they are designed to work as a systems approach to EMS and integrate with one another. Contact the NHTSA EMS Division to obtain copies of these resources.

In 1994, the National Registry of Emergency Medical Technicians (NREMT) performed the first nationally conducted practice analysis of EMS. The information obtained in the first analysis was used in the development of the 1998 EMT-Paramedic and 1999 EMT-Intermediate: NSC. In 1999, the NREMT conducted its second practice analysis.

The 1999 NREMT Practice Analysis is a scientific, randomized national sampling of practicing EMT-Paramedic and EMT-Intermediates. The EMT’s participating in the practice analysis provided data on 123 various patient assessments focusing on patient care and operational tasks that make up the day-to-day functions of the providers. Each provider indicated the frequency they performed each task and the potential for harm they experienced accomplishing each task. A Practice Analysis Committee reviewed the data, validated the responses, and published the data in a peer reviewed medical journal. The NREMT Practice Analysis Committee used this data to develop a plan that grouped the identified tasks into the following six content areas:

- Airway and Breathing
- Cardiology
- Medical
- Trauma
- Pediatrics/Obstetrics
- Operations

The specific tasks from the practice analysis are listed in appendix A. The NREMT supplied the data from their practice analysis to the EMT-Paramedic refresher development task force. This information was used to help determine specific content for the refresher course.

The refresher task force used the NREMT data to identify tasks that are infrequent and may cause potential harm to the patient if delayed, performed improperly, or omitted when providing care. The panel decided to “refresh” these tasks since patient outcome is jeopardized if the task is not correctly performed. An example of this would be “Provide care to an infant or child with cardiac arrest.” The practice analysis categorizes this task as number 113 of 123 for frequency, but lists it as the number one task for potential for harm. The panel agreed and decided to include this task as a mandatory part of the refresher program.

Likewise, a task such as “Provide care to a patient with a painful, swollen, deformed extremity” is listed as task number 98 in frequency and number 100 as potential for harm. This task is not included as a mandatory part of the refresher program. Other tasks that are performed frequently and lack potential for harm are not included as a mandatory part of this refresher program. Again, the refresher course only targets infrequently performed tasks with a high potential for harm.
Upon further review of the practice analysis, the task force identified a few frequently performed tasks that have a very high potential for harm. The task force decided to also include all tasks with a high potential for harm, regardless of their frequency of performance.

Another tool used in the development of this refresher program was an EMS literature review. The literature review found issues not identified by the data from the NREMT Practice Analysis. The task force also sought expert opinion and feedback from the EMS community to identify additional course content.

**COURSE OVERVIEW**

Traditional refresher programs refresh material already known by the students. The intent of these programs is to maintain a student’s competence in knowledge and skill performance. This refresher program embraces the same concept, but it also encourages the inclusion of new and expanded information. New and expanded information may be added to the course but not at the expense of content that is core material for the program. This course is not designed to be continuing education for the participants. If a system wishes to incorporate additional information or a new intervention that requires a substantial amount of time to teach, the information must be offered in addition to the content of the refresher program. Moreover, this course is not a transition or bridge course for current EMT-Paramedics to become certified at the revised 1998 EMT-Paramedic level.

The participant make-up in a refresher program may challenge the instructional staff. Participants who attend a refresher program may do so for a variety of reasons. Some students may not have practiced for a period of time and are attending to gain back their level of competence prior to practicing again. Others may attend to remediate or gain refresher or continuing education hours. Knowledge of the participant make-up will help the instructors meet the participant’s needs. A thorough knowledge of the re-credentialing requirements and approval process is a must for any organization sponsoring a refresher program.

**NREMT PRACTICE ANALYSIS TASK ITEMS**

The *NREMT Practice Analysis* task items are listed at the beginning of each module. These tasks are included based upon their performance frequency and potential for harm.

**OBJECTIVES and DECLARATIVE MATERIAL**

The objectives and declarative material are extracted from the 1998 EMT-Paramedic: NSC and they support the identified practice analysis tasks. The objectives and declarative material are renumbered for formatting purposes; however, the original objective number from the NSC is found at the end of each objective. The declarative material provides guidance for programs to use to establish their own individual lesson plans.
The objectives in modules 1-5 are mandatory objectives and must be included in every refresher program. The objectives for the operational section should be considered recommended content for the refresher course. Any other objectives and declarative information has not been included and should be developed by the sponsoring agency.

**TIME REQUIREMENTS**

The length of this refresher program will vary according to a number of factors. Some of these factors are as follows:

- The student’s basic academic skills competence
- The student’s EMS knowledge and skills
- The faculty to student ratio
- The student’s motivation
- The student’s prior emergency/health care experience
- The student’s prior academic achievements
- The clinical and academic resources available
- The quantity of patient contacts

The recommended time to instruct the mandatory objectives for the refresher program is 40 to 80 hours. Training institutes will need to adjust these times based on their individual needs. The agencies responsible for program oversight are cautioned against using these hours as a measure of program quality. Competence of the participants, not adherence to arbitrary time frames, is the true measurement of program quality.

**COURSE PLANNING CONSIDERATIONS**

**NEEDS ASSESSMENT**

The first step for the needs assessment is the performance of a comprehensive analysis of the factors that influence the local pre-hospital emergency care delivery system. Some factors included in this analysis are:

- Recertification requirements (local, state, national, professional).
- System structure.
- Call characteristics (i.e., volume, type).
- Community demographics.
- Community hazard assessment.

The second step of the needs assessment is an analysis of the education needs of the course participants. This assessment may include the following:

- Pre-testing
- Surveys
- Observations
The information collected during the assessment process may be used as a guide to select specific material for the classroom. The assessment results can determine the course format, course schedule, and course methods. The selected material may be subjected to national, State, and local standards.

COURSE DESIGN

The following steps will assist with the design and implementation of the course design.

**Determine regulatory requirements for course conduct:**
The refresher course will be approved or accredited by the appropriate local or state agency. A part of this approval process will be the length of the course, the course content, and the faculty requirements or restrictions.

**Develop schedule:**
The course is designed to allow programs to present the material in a variety of formats. The program may be delivered in class sessions that might include 8 hour consecutive days or may be taught in a shorter sessions extended over a period of months.

**Determine class size:**
The course emphasizes the evaluation of participant skills. Class size should be manageable and allow students an opportunity to ask questions and receive answers or assistance from the instructor.

Since the instructor must observe and evaluate student performance, it is essential that the group’s size not be too large when evaluating practical skills. Consider segmenting the class into smaller groups, such as 6:1 (students to instructor) when doing the practical skills session.

METHODS of DELIVERY

INSTRUCTOR ATTRIBUTES

Instructing a refresher program for practicing EMT-Paramedics is a challenge. We often hear that refresher programs lack challenge, cover material already well known, and are not deemed as useful for the participants. Faculty members must possess expertise in both the content area they instruct and in multiple delivery styles. Instructors must be proficient in performing the skills that they are instructing. Knowing your student’s abilities and the local EMS system’s expectations is essential for a successful program.

Instructional staff must be appropriately credentialed according to local or state requirements. The course medical director must be available throughout the program.
and be aware of the course design and evaluation instruments being used. The course medical director may be utilized for medical expertise.

**INSTRUCTIONAL APPROACH**

Given the repetitive nature of refresher education, it is easy for participants to become bored and lack enthusiasm about the program. The overuse of lecturing is ineffective as the sole method of learning. To improve the quality of the educational experience for instructors and participants, creative and innovative instructional activities are strongly recommended. Consider using some of the following:

**Case Presentation**

Case presentation and discussion helps participants apply and understand the content by relating to their field experiences. The instructional staff can generate cases by using actual calls. Instructors should develop case studies to highlight key points of their presentations and the area of content being delivered. The most successful case presentations are those placing the participant(s) in a decision-making role allowing them to see the consequences of their decisions. Case presentations can be used in any format, such as, large classes, small groups, and individual instruction. Several examples and templates for case construction are in Appendix B.

**Simulations**

Simulations are case presentations incorporating role-playing situations. The role players may be other participants, programmed (standardized) patients, or manikins. Simulations work best when they are realistic and present situations the participant(s) may encounter, highlighting key points of the content area. Instructors and participants may critique simulations if the classroom environment is adequate.

**Technology**

We live in a time when technology is expanding in development and practical use. Though it is hard to say what will be the state of the art delivery system for education resources in the future, participation by the student will likely enhance the learning process.

**DISTRIBUTED LEARNING**

Distributed learning includes several alternative methods and media usage. Self-study programs, videotapes, audiotapes, and computer-based instruction are just a few examples of distributed learning. These alternative methods of instruction provide an opportunity to review and learn new cognitive knowledge, but they may not replace the need to practice or demonstrate a psychomotor skill. The use of a distributed learning process may best be applied in the remediation of cognitive knowledge identified in a needs assessment. Course directors and the credentialing agency should evaluate distributed learning products to assure that they meet the course goals and objectives.
EVALUATING THE PARTICIPANTS

In order for the refresher program sponsor to issue a certificate of program completion an evaluation process must be employed. The evaluation process should measure both cognitive knowledge and psychomotor skills. Individuals who are unsuccessful may be counseled and a course of action for remediation developed.

COGNITIVE EVALUATION

Authoring a valid written evaluation is both a science and an art. While some instructors possess skills in writing test questions, some others may not. A variety of commercially available test question banks may be useful to the instructional staff during the refresher program. Regardless of the tool used, the purpose of the cognitive measurement tool must be known before a test can be validated. The instructional staff must use basic test construction principles to develop written evaluation instruments.

Written evaluation questions should be balanced to the program content. Items should be based upon what is taught and emphasized throughout the program and should have a difficulty measurement. A test written so each participant can obtain a score of 90% without taking the course lacks measurement ability and validation. Test items must be reviewed by faculty members, including the course medical director, to ensure content validation. Correct answers need to be the best choice or the only correct answer. Incorrect answers and distracters should be plausible to the item and have some attraction to the less than competent participant. Finally, a pass/fail score should be established based upon item analysis and judgment by faculty members responsible for issuing course completion certificates.

PSYCHOMOTOR EVALUATION

The following have been identified as essential items in the 2001 EMT-Paramedic Refresher Program:

- Trauma assessment
- Medical assessment
- Ventilation
  - Adult
  - Pediatric
- Cardiac arrest management
  - Adult
  - Pediatric
- Medication administration
  - Intravenous
  - Intravenous
- Oral scenarios
Basic skills
  Seated spinal immobilization
  Femoral/longbone immobilization
  Wounds, bleeding, and shock management
  Lifting, moving, and carrying patients

Validation of psychomotor performance must be accomplished prior to issuing a certificate of course completion. Three opportunities are available to the instructional staff to validate a participant’s performance.

**Pretest**
The use of a psychomotor pretest is the best measurement of an individual’s performance. The pretest identifies skills that need to be emphasized during the course. Likewise, if all candidates possess competency in a skill prior to taking the program, it may not be necessary to cover that skill.

**Skill Labs**
When the sponsoring agency does not administer a pretest, the staff can use the skill labs to measure the competency of each participant. The skill labs ensure validation is sprinkled throughout the refresher program.

**End of Program**
At the end of the refresher program an evaluation process can be utilized if a pretest and skill labs were not used. If an end of program evaluation process is used, some skills may need to be re-evaluated if participants are unsuccessful.

Participants must have documentation of demonstrating competence for each skill identified during the program regardless of what process is used.

The refresher curriculum is the minimum acceptable content to be covered by education programs. With certifying agency approval, the student may meet some program objectives by satisfactorily completing a nationally recognized trauma life support program, cardiac care program, or pediatric care program. Although some certifying agencies allow providers to attend continuing education programs, it is recommended that providers participate in regularly scheduled group education sessions as well.

**REMEDIATION**

Participants who do not complete the program’s objectives or pass the evaluation process should have their performance reviewed by one of the instructional staff members. The participant’s strengths and weaknesses should be identified and a plan developed that helps the participant successfully complete the requirements. This plan may include additional classroom time, clinical time, field time, or repeating the entire program.
Refresher programs are often provided by the same instructional staff in a variety of settings to different groups of participants. The program staff should evaluate each program for its effectiveness when completed. The evaluation can include the participant’s point of view by administering post program evaluation surveys. Some questions to ask when evaluating program effectiveness include:

- Did the program conform to the course design?
- Were the resources adequate?
- Were the skills labs effective?
- Did the test provide valuable information?
- Were the instructors effective in delivering the material?
- Can other instructional methods be incorporated in future courses?
- What were the participant comments?
- Was the course cost effective?

At the end of each program, the faculty and course medical director must meet to determine if the course met its desired needs. The faculty needs to review content design, measurements, course completion criteria, and participant comments. Adjustments to future programs may be indicated once the evaluation process is complete.
**Acknowledgments**

The development of this document would not have been possible without the involvement and help of the following task force members and organizations. Gratitude and thanks are also extended to all the individuals who made comments during the development of this document.

Module I: Airway / Ventilation
NREMT PRACTICE ANALYSIS TASK ITEM
- Provide ventilatory support for a patient.

COGNITIVE OBJECTIVES
At the completion of this unit, the paramedic will be able to:

1.1 Describe the indications, contraindications, advantages, disadvantages, complications, and technique for ventilating a patient by: (C-1) / 2-1.43
   - Mouth-to-mouth
   - Mouth-to-nose
   - Mouth-to-mask
   - One person bag-valve-mask
   - Two person bag-valve-mask
   - Three person bag-valve-mask
   - Flow-restricted, oxygen-powered ventilation device

1.2 Compare the ventilation techniques used for an adult patient to those used for pediatric patients. (C-3) / 2-1.45

1.3 Describe indications, contraindications, advantages, disadvantages, complications, and technique for ventilating a patient with an automatic transport ventilator (ATV). (C-1) / 2-1.46

1.4 Define how to ventilate with a patient with a stoma, including mouth-to-stoma and bag-valve-mask-to-stoma ventilation. (C-1) / 2-1.54

1.5 Describe the special considerations in airway management and ventilation for patients with facial injuries. (C-1) / 2-1.55

1.6 Describe the special considerations in airway management and ventilation for the pediatric patient. (C-1) / 2-1.56

PSYCHOMOTOR OBJECTIVES
At the completion of this unit, the paramedic will be able to:

1.7 Demonstrate ventilating a patient by the following techniques: (P-2) / 2-1.95
   - Mouth-to-mask ventilation
   - One person bag-valve-mask
   - Two person bag-valve-mask
   - Three person bag-valve-mask
   - Flow-restricted, oxygen-powered ventilation device
   - Automatic transport ventilator
   - Mouth-to-stoma
   - Bag-valve-mask-to-stoma ventilation

1.8 Ventilate a pediatric patient using the one and two person techniques. (P-2) / 2-1.96

1.9 Perform bag-valve-mask ventilation with an in-line small-volume nebulizer. (P-2) / 2-1.97

1.10 Perform assessment to confirm correct placement of the endotracheal tube (P-2) / 2-1.103

1.11 Intubate the trachea by the following methods:
   - Orotracheal intubation
   - Nasotracheal intubation
   - Multi-lumen airways

1.12 Perform transtracheal catheter ventilation (needle cricothyrotomy). (P-2) / 2-1.107
I  Ventilation
   A  Mouth-to-mouth
      1  Most basic form of ventilation
      2  Indications
         a  Apnea from any mechanism when other ventilation devices are not available
      3  Contraindications
         a  Awake patients
         b  Communicable disease risk limitations
      4  Advantages
         a  No special equipment required
         b  Delivers excellent tidal volume
         c  Delivers adequate oxygen
      5  Disadvantages
         a  Psychological barriers from
            i  Sanitary issues
            ii  Communicable disease issues
               a)  Direct blood/ body fluid contact
               b)  Unknown communicable disease risks at time of event
      6  Complications
         a  Hyperinflation of patient's lungs
         b  Gastric distention
         c  Blood/ body fluid contact manifestation
         d  Hyperventilation of rescuer
   B  Mouth-to-nose
      1  Ventilating through nose rather than mouth
      2  Indications
         a  Apnea from any mechanism
      3  Contraindications
         a  Awake patients
      4  Advantages
         a  No special equipment required
      5  Disadvantages
         a  Direct blood/ body fluid contact
         b  Psychological limitations of rescuer
      6  Complications
         a  Hyperinflation of patient's lungs
         b  Gastric distention
         c  Blood/ body fluid manifestation
         d  Hyperventilation of rescuer
   C  Mouth-to-mask
      1  Adjunct to mouth-to-mouth ventilation
      2  Indications
         a  Apnea from any mechanism
      3  Contraindications
         a  Awake patients
4 Advantages
a Physical barrier between rescuer and patient blood/body fluids
b One-way valve to prevent blood/body fluid splash to rescuer
c May be easier to obtain face seal

5 Disadvantages
a Useful only if readily available

6 Complications
a Hyperinflation of patient's lungs
b Hyperventilation of rescuer
c Gastric distention

7 Method for use
a Position head by appropriate method
b Position and seal mask over mouth and nose
c Ventilate as appropriate

D One person bag-valve-mask
1 Fixed volume self inflating bag can deliver adequate tidal volumes and O₂ enrichment
2 Indications
a Apnea from any mechanism
b Unsatisfactory respiratory effort
3 Contraindications
a Awake, intolerant patients
4 Advantages
a Excellent blood/body fluid barrier
b Good tidal volumes
c Oxygen enrichment
d Rescuer can ventilate for extended periods without fatigue

5 Disadvantages
a Difficult skill to master
b Mask seal may be difficult to obtain and maintain
c Tidal volume delivered is dependent on mask seal integrity

6 Complications
a Inadequate tidal volume delivery
b Poor technique
c Poor mask seal
d Gastric distention

7 Method for use
a Position appropriately
b Choose proper mask size – seats from bridge of nose to chin
c Position, spread/mold/seal mask
d Hold mask in place
e Squeeze bag completely over 1.5 to 2 seconds for adults
f Avoid overinflation
g Reinflate completely over several seconds

8 Special considerations
a Medical
i Observe for
   a) Gastric distention
   b) Changes in compliance of bag with ventilation
c) Improvement or deterioration of ventilation status (i.e., color change, responsiveness, air leak around mask)
   b) Trauma
      i) Very difficult to perform with cervical spine immobilization in place

E Two-person bag-valve-mask ventilation method
1 Most efficient method
2 Indications
   a) Bag-valve-mask ventilation on any patient
      i) Especially useful for cervical spine immobilized patients
      ii) Difficulty obtaining or maintaining adequate mask seal
3 Contraindications
   a) Awake, intolerant patients
4 Advantages
   a) Superior mask seal
   b) Superior volume delivery
5 Disadvantages
   a) Requires extra personnel
6 Complications
   a) Hyperinflation of patient's lungs
   b) Gastric distention
7 Method for use
   a) First rescuer maintains mask seal by appropriate method
   b) Second rescuer squeezes bag
8 Special considerations
   a) Observe chest movement
   b) Avoid overinflation
   c) Monitor lung compliance with ventilations

F Three-person bag-valve-mask ventilation
1 Indications
   a) Bag-valve-mask ventilation on any patient
      i) Especially useful for cervical spine immobilized patients
      ii) Difficulty obtaining or maintaining adequate mask seal
2 Contraindications
   a) Awake, intolerant patients
3 Advantages
   a) Superior mask seal
   b) Superior volume density
4 Disadvantages
   a) Requires extra personnel
   b) “Crowded” around airway
5 Complications
   a) Hyperinflation of patient’s lungs
   b) Gastric distention
6 Method for use
   a) First rescuer maintains mask seal by appropriate method
   b) Second rescuer holds mask in place
   c) Third rescuer squeezes bag and monitors compliance
7 Special considerations
   a Avoid overinflation
   b Monitor lung compliance with ventilations

G Flow-restricted, oxygen-powered ventilation devices
1 The valve opening pressure at the cardiac sphincter is approx 30 cm H₂O
2 These devices operate at or below 30 cm H₂O to prevent gastric distention
3 Indications
   a Delivery of high volume/ high concentration of O₂ (1 L/sec)
   b Awake compliant patients
   c Unconscious patient with caution
4 Contraindications
   a Non-compliant patients
   b Poor tidal volume
   c Small children
5 Advantages
   a Self administered
   b Delivers high volume/ high concentration O₂
   c O₂ delivered in response to inspiratory effort (no O₂ wasting)
   d O₂ volume delivery is regulated by inspiratory effort minimizing overinflation risk
   e O₂ volume delivery is also restricted to less than 30 cm H₂O
6 Disadvantages
   a Cannot monitor lung compliance
   b Requires O₂ source
7 Complications
   a Gastric distention
   b Barotrauma
8 Method
   a Mask is held manually in place
   b Negative pressure upon inspiration triggers O₂ delivery or medic triggers release button
   c Patient is monitored for adequate tidal volume and oxygenation

H Automatic transport ventilators
1 Volume/ rate controlled
2 Indications
   a Extended ventilation of intubated patients
   b In situations in which a BVM is used
   c Can be used during CPR
3 Contraindications
   a Awake patients
   b Obstructed airway
   c Increased airway resistance
      i Pneumothorax (after needle decompression)
      ii Asthma
      iii Pulmonary edema
4 Advantages
   a Frees personnel to perform other tasks
   b Lightweight
   c Portable
d  Durable
e  Mechanically simple
f  Adjustable tidal volume
g  Adjustable rate
h  Adapts to portable O₂ tank

5  Disadvantages
   a  Cannot detect tube displacement
   b  Does not detect increasing airway resistance
   c  Difficult to secure
   d  Dependent on O₂ tank pressure

I  Cricoid pressure – Sellick’s maneuver
1  Pressure on cricoid Ring
2  Occludes esophagus
3  Facilitates intubation by moving the larynx posteriorly
4  Helps to prevent passive emesis
5  Can help minimize gastric distention during bag-valve-mask ventilation

6  Indications
   a  Unconscious patients receiving BVM ventilations
   b  Patient cannot protect own airway

7  Contraindications
   a  Use with caution in cervical spine injury

8  Advantages
   a  Noninvasive
   b  Minimizes risk of aspiration as long as pressure is maintained

9  Disadvantages
   a  May have extreme emesis if pressure is removed
   b  Second rescuer required for bag-valve-mask ventilation
   c  May further compromise injured cervical spine

10 Complications
   a  Laryngeal trauma with excessive force
   b  Esophageal rupture from unrelieved high gastric pressures
   c  Excessive pressure may obstruct the trachea in small children

11 Method
   a  Locate the anterior aspect of the cricoid ring
   b  Apply firm, posterior pressure
   c  Maintain pressure until the airway is secured with an endotracheal tube

J  Artificial ventilation of the pediatric patient
1  Flat nasal bridge makes achieving mask seal more difficult
2  Compressing mask against face to improve mask seal results in obstruction
3  Mask seal best achieved with jaw displacement (two person bag-valve-mask)
4  Bag-valve-mask ventilation
   a  Bag size
      i  Full-term neonates and infants – minimum of 450 ml tidal volume (pediatric BVM)
      ii  Children up to eight years of age – pediatric BVM preferred but adult-sized BVM (1500 ml) may be used
      iii  Children over eight years of age require adult-sized BVM for adequate ventilation
iv Proper mask fit
v Length based resuscitation tape
vi Bridge of nose to cleft of chin
b Proper mask position and seal (EC-clamp)
i Place mask over mouth and nose; avoid compressing the eyes
ii Using one hand, place thumb on mask at apex and index
   finger on mask at chin (C-grip)
iii With gentle pressure, push down on mask to establish
   adequate seal
iv Maintain airway by lifting bony prominence of chin with
   remaining fingers forming an “E”; avoid placing pressure on
   the soft area under chin
v May use one or two rescuer technique
c Ventilate according to current standards
d Obtain chest rise with each breath
i Begin ventilation and say “squeeze”; provide just enough
   volume to initiate chest rise; DO NOT OVERVENTILATE
e Allow adequate time for exhalation
i Begin releasing the bag and say “release, release”
f Continue ventilations using “squeeze, release, release” method
g Assess BVM ventilation
i Look for adequate chest rise
ii Listen for lung sounds at third intercostal space, midaxillary
   line
iii Assess for improvement in color and/or heart rate
h Apply cricoid pressure to minimize gastric inflation and passive
   regurgitation
i Locate cricoid ring by palpating the trachea for a prominent
   horizontal band inferior to the thyroid cartilage and
   cricothyroid membrane
ii Apply gentle downward pressure using one fingertip in infants
   and the thumb and index finger in children
iii Avoid excessive pressure as it may produce tracheal
   compression and obstruction in infants

K Ventilation of stoma patients
1 Mouth-to-stoma
   a Locate stoma site and expose
   b Pocket mask to stoma preferred
      i Seal around stoma site, check for adequate ventilation
      ii Seal mouth and nose if air leak evident

2 Bag-valve-mask to stoma
   a Locate stoma site and expose
   b Seal around stoma site, check for adequate ventilation
   c Seal mouth and nose if air leak evident

L Translaryngeal cannula ventilation
1 High volume/ high-pressure ventilation of lungs through cannulation of
   trachea below the glottis
   a Oxygen delivery differs from other methods
   b Delivers a large volume of O₂ through a small port
c Delivers a very high pressure to the lungs compared to other methods
(50 psi versus less than 1 psi through a regulator)

2 Indications
a Apnea
b Delayed or inability to ventilate the patient by other means

3 Contraindications
a Total airway obstruction (both inspiratory and expiratory)
b Equipment not immediately available

c Indications
b Delayed or inability to ventilate the patient by other means

II Airway Techniques

A Endotracheal intubation techniques
1 Medical patient
   a Orotracheal intubation by direct laryngoscopy
2 Trauma patient
   a Orotracheal intubation by direct laryngoscopy
   b Nasotracheal intubation techniques
      i Indications
3 Confirming placement
   a Direct re-visualization
   b Tube condensation
   c Auscultation
   d Palpation of balloon cuff at sternal notch
   e Pulse oximetry
   f Expired CO₂
   g Bag-valve ventilation compliance
4 Field extubation
5 Endotracheal tube securing device

B Multi-lumen airways
1 Pharyngo-tracheal lumen airway
   a Indications
   b Advantages
   c Disadvantages
   d Method

Module II: Cardiovascular
NREMT PRACTICE ANALYSIS TASK ITEMS

- Provide care to a patient experiencing cardiovascular compromise.
- Attempt to resuscitate a patient in cardiac arrest.
- Provide post-resuscitation care to a cardiac arrest patient.

COGNITIVE OBJECTIVES

At the completion of this unit, the paramedic will be able to:

2.1 Identify the major therapeutic objectives in the treatment of patients with any arrhythmia. (C-1) / 5-2.51
2.2 Identify the major mechanical, pharmacological and electrical therapeutic interventions. (C-3) / 5-2.52
2.3 Based on field impressions, identify the need for rapid intervention for the patient in cardiovascular compromise. (C-3) / 5-2.53
2.4 Identify the clinical indications for transcutaneous and permanent artificial cardiac pacing. (C-1) / 5-2.55
2.5 Describe the components and the functions of a transcutaneous pacing system. (C-1) / 5-2.56
2.6 Explain what each setting and indicator on a transcutaneous pacing system represents and how the settings may be adjusted. (C-2) / 5-2.57
2.7 Describe the techniques of applying a transcutaneous pacing system. (C-1) / 5-2.58
2.8 Specify the measures that may be taken to prevent or minimize complications in the patient suspected of myocardial infarction. (C-3) / 5-2.83
2.9 Describe the most commonly used cardiac drugs in terms of therapeutic effect and dosages, routes of administration, side effects and toxic effects. (C-3) / 5.2.84
2.10 List the interventions prescribed for the patient in acute congestive heart failure. (C-2) / 5-2.94
2.11 Describe the most commonly used pharmacological agents in the management of congestive heart failure in terms of therapeutic effect, dosages, routes of administration, side effects and toxic effects. (C-1) / 5-2.95
2.12 Identify the paramedic responsibilities associated with management of a patient with cardiac tamponade. (C-2) / 5-2.101
2.13 From the priority of clinical problems identified, state the management responsibilities for the patient with a hypertensive emergency. (C-2) / 5-2.109
2.14 Identify the drugs of choice for hypertensive emergencies, rationale for use, clinical precautions and disadvantages of selected antihypertensive agents. (C-3) / 5-2.110
2.15 Describe the most commonly used pharmacological agents in the management of cardiogenic shock in terms of therapeutic effects, dosages, routes of administration, side effects and toxic effects. (C-2) / 5-2.118
2.16 Identify the paramedic responsibilities associated with management of a patient in cardiogenic shock. (C-2) / 5-2.120
2.17 Identify the critical actions necessary in caring for the patient with cardiac arrest. (C-2) / 5-2.125
2.18 Describe the most commonly used pharmacological agents in the management of cardiac arrest in terms of therapeutic effects. (C-3) / 5-2.129
2.19 Develop, execute, and evaluate a treatment plan based on field impression for the patient in need of a pacemaker. (C-3) / 5-2.158
2.20 Develop, execute, and evaluate a treatment plan based on the field impression for the heart failure patient. (C-3) / 5-2.168
2.21 Develop, execute and evaluate a treatment plan based on the field impression for the patient with cardiac tamponade. (C-3) / 5-2.171
2.22 Develop, execute and evaluate a treatment plan based on the field impression for the patient with a hypertensive emergency. (C-3) / 5-2.171
2.23 Develop, execute, and evaluate a treatment plan based on the field impression for the patient with cardiogenic shock. (C-3) / 5-2.177
2.24 Integrate pathophysiological principles to the assessment and field management of a patient with chest pain. (C-3) / 5-2.183

PSYCHOMOTOR OBJECTIVES
At the completion of this unit, the paramedic will be able to:

2.25 Set up and apply a transcutaneous pacing system. (P-3) / 5-2.202
2.26 Given the model of a patient with signs and symptoms of heart failure, position the patient to afford comfort and relief. (P-2) / 5-2.203
2.27 Demonstrate satisfactory performance of psychomotor skills of basic and advanced life support techniques according to the current American Heart Association Standards and Guidelines, including: (P-3) / 5-2.205
   • Cardiopulmonary resuscitation
   • Defibrillation
   • Synchronized cardioversion
   • Transcutaneous pacing
DEclarative

I. Management of the patient with arrhythmias
   A. Assessment
   B. Pharmacological
      1. Gases (such as oxygen)
      2. Sympathetic (such as epinephrine)
      3. Anticholinergic (such as atropine)
      4. Antiarrhythmic (such as lidocaine)
      5. Beta blocker
         a. Selective (such as metoprolol)
         b. Non-selective (such as propranolol)
      6. Vasopressor (such as dopamine)
      7. Calcium channel blocker (such as verapamil)
      8. Purine nucleoside (such as adenosine)
      9. Platelet aggregate inhibitor (such as aspirin)
     10. Alkalinizing agents (such as sodium bicarbonate)
     11. Cardiac glycoside (such as digitalis)
     12. Narcotic/analgesic (such as morphine)
     13. Diuretic (such as furosemide)
     14. Nitrate (such as nitroglycerin)
     15. Antihypertensive (such as sodium nitroprusside)
   C. Electrical
      1. Purpose
      2. Methods
         a. Synchronized cardioversion
         b. Defibrillation
      3. Cardiac pacing
         a. Implanted pacemaker functions
            i. Characteristics
            ii. Pacemaker artifact
            iii. ECG tracing of capture
            iv. Failure to sense
               a) ECG findings
               b) Clinical significance
            v. Failure to capture
               a) ECG findings
               b) Clinical significance
            vi. Failure to pace
               a) ECG findings
               b) Clinical significance
            vii. Pacer-induced tachycardia
               a) ECG findings
               b) Clinical significance
               c) Treatment
         b. Transcutaneous pacing
            i. Criteria for use
            ii. Bradycardia
Module II: Cardiovascular

2001 EMT-Paramedic Refresher

II-4

a) Patient is hypotensive/ hypoperfusing
b) No change with pharmacologic intervention

iii Second degree AV block
   a) Patient is hypotensive/ hypoperfusing
   b) No change with pharmacologic intervention

iv Complete AV block
   a) Patient is hypotensive/ hypoperfusing
   b) No change with pharmacologic intervention

v Asystole

vi Overdrive
   a) Deter occurrence of recurrent tachycardia

4 Set-up
   a) Placement of electrodes
   b) Rate and milliampere (mA) settings
   c) Pacer artifact
   d) Capture
   e) Failure to sense
      i) Causes
      ii) Implications
      iii) Interventions
   f) Failure to capture
      i) Causes
      ii) Implications
      iii) Interventions
   g) Failure to pace
      i) Causes
      ii) Implications
      iii) Interventions
   h) Hazards
      i) Complications
      ii) Interventions

D Transport
1 Indications for rapid transport
2 Indications for no transport required
3 Indications for referral

E Support and communications strategies
1 Explanation for patient, family, significant others
2 Communications and transfer of data to the physician

II Myocardial infarction
A Epidemiology
B Morbidity / Mortality
C Initial Assessment Findings
D Focused History
E Detailed Physical Exam
F Management
1 Position of comfort
2 Pharmacological
Module II: Cardiovascular

2001 EMT-Paramedic Refresher

| a | Gases |
| b | Nitrates |
| c | Platelet aggregate inhibitor |
| d | Analgesia |
| e | Increase or decrease heart rate |
| f | Possible antiarrhythmic |
| g | Possible antihypertensives |

3 Electrical
| a | Constant ECG monitoring |
| b | Defibrillation/ synchronized cardioversion |
| c | Transcutaneous pacing |

4 Transport
| a | Criteria for rapid transport |
| i | No relief with medications |
| a) | Hypotension/ hypoperfusion |
| b) | Significant changes in ECG |
| b | ECG criteria for rapid transport and reperfusion |
| i | Time of onset of pain |
| ii | ECG rhythm abnormalities |
| c | Indications for “no transport” |
| i | Refusal |
| ii | No other indications for no-transport |
| d | Support and communications strategies |

      1  Explanation for patient, family, significant others
      2  Communications and transfer of data to the physician
Module II: Cardiovascular

VI Cardiogenic Shock
A Pathophysiology
B Initial Assessment
C Focused History
D Detailed Physical Examination
E Management
1 Position of comfort
   a May prefer sitting upright with legs in dependent position
2 Pharmacological
   a Gases
   b Vasopressor
   c Analgesia
   d Diuretics
   e Glycoside
   f Sympathetic agonist
   g Alkalinizing agent
   h Other
F Transport
1 Refusal
2 No other indications for no transport
G Support and communications strategies
1 Explanation for patient, family, significant others
2 Communications and transfer of data to the physician

VII Cardiac arrest
A Pathophysiology
B Initial assessment
C Focused history
D Management
1 Related terminology
   a Resuscitation – to provide efforts to return spontaneous pulse and breathing to the patient in full cardiac arrest
   b Survival – patient is resuscitated and survives to hospital discharge
   c Return of spontaneous circulation (ROSC) – patient is resuscitated to the point of having pulse without CPR; may or may not have return of spontaneous respirations; patient may or may not go on to survive
2 Indications for NOT initiating resuscitative techniques
   a Signs of obvious death
      i For example – rigor; fixed lividity; decapitation
   b Local protocol
      i For example – out-of-hospital advance directives
3 Advanced airway management and ventilation
4 Circulation
   a CPR in conjunction with defibrillation
   b IV therapy
   c Defibrillation
   d Pharmacological
Module II: Cardiovascular

i Gases (oxygen)
ii Sympathetic
iii Anticholinergic
iv Antiarrhythmic
v Vasopressor
vi Alkalinizing agents
vii Parasympatholytic

5 Rapid transport
6 Support and communications strategies
   a Explanation for patient, family, significant others
   b Communications and transfer of data to the physician
Module III: Medical
NREMT PRACTICE ANALYSIS TASK ITEMS

- Assess a patient experiencing an allergic reaction
- Provide care to the patient experiencing an allergic reaction
- Assess a near drowning patient
- Provide care to a near drowning patient
- Assess a patient with a possible overdose

COGNITIVE OBJECTIVES

At the completion of this unit, the paramedic will be able to:

3.1 Describe physical manifestations in anaphylaxis. (C-1) / 5-5.13
3.2 Differentiate manifestations of an allergic reaction from anaphylaxis. (C-3) / 5-5.14
3.3 Recognize the signs and symptoms related to anaphylaxis. (C-1) / 5-5.15
3.4 Differentiate among the various treatment and pharmacological interventions used in the management of anaphylaxis. (C-3) / 5-5.16
3.5 Correlate abnormal findings in assessment with the clinical significance in the patient with anaphylaxis. (C-3) / 5-5.18
3.6 Develop a treatment plan based on field impression in the patient with allergic reaction and anaphylaxis. (C-3) / 5-5.19
3.7 List signs and symptoms of near-drowning. (C-1) / 5-10.54
3.8 Describe the lack of significance of fresh versus saltwater immersion, as it relates to near-drowning. (C-3) / 5-10.55
3.9 Discuss the incidence of "wet" versus "dry" drownings and the differences in their management. (C-3) / 5-10.56
3.10 Discuss the complications and protective role of hypothermia in the context of near-drowning. (C-1) / 5-10.57
3.11 Correlate the abnormal findings in assessment with the clinical significance in the patient with near-drowning. (C-3) / 5-10.58
3.12 Differentiate among the various treatments and interventions in the management of near-drowning. (C-3) / 5-10.59
3.13 Integrate pathophysiological principles and assessment findings to formulate a field impression and implement a treatment plan for the near-drowning patient. (C-3) / 5-10.60
3.14 Differentiate toxic substance emergencies based on assessment findings. (C-3) / 5-8.60
3.15 Correlate abnormal findings in the assessment with the clinical significance in the patient exposed to a toxic substance. (C-3) / 5-8.61
3.16 Correlate the abnormal findings in assessment with the clinical significance in patients with the most common poisonings by overdose. (C-3) / 5-8.44
3.17 Correlate the abnormal findings in assessment with the clinical significance in patients using the most commonly abused drugs. (C-3) / 5-8.53
3.18 List the clinical uses, street names, pharmacology, assessment finding and management for patient who have taken the following drugs or been exposed to the following substances: (C-1) / 5-8.56
- Cocaine
- Marijuana and cannabis compounds
- Amphetamines and amphetamine-like drugs
- Barbiturates
- Sedative-hypnotics
• Cyanide
• Narcotics/ opiates
• Cardiac medications
• Caustics
• Common household substances
• Drugs abused for sexual purposes/ sexual gratification
• Carbon monoxide
• Alcohols
• Hydrocarbons
• Psychiatric medications
• Newer anti-depressants and serotonin syndromes
• Lithium
• MAO inhibitors
• Non-prescription pain medications
• Nonsteroidal antiinflammatory agents
• Salicylates
• Acetaminophen
• Metals
• Plants and mushrooms
DECLARATIVE

I Anaphylaxis
   A Epidemiology
   B Pathophysiology
   C Assessment findings
      1 Not all signs and symptoms are present in every case
      2 History
         a Previous exposure
         b Previous experience to exposure
         c Onset of symptoms
         d Dyspnea
      3 Level of consciousness
         a Unable to speak
         b Restless
         c Decreased level of consciousness
         d Unresponsive
      4 Upper airway
         a Hoarseness
         b Stridor
         c Pharyngeal edema/ spasm
      5 Lower airway
         a Tachypnea
         b Hypoventilation
         c Labored – accessory muscle use
         d Abnormal retractions
         e Prolonged expirations
         f Wheezes
         g Diminished lung sounds
      6 Skin
         a Redness
         b Rashes
         c Edema
         d Moisture
         e Itching
         f Urticaria
         g Pallor
         h Cyanotic
      7 Vital signs
         a Tachycardia
         b Hypotension
      8 Gastrointestinal
         a Abnormal cramping
         b Nausea/ vomiting
         c Diarrhea
      9 Assessment tools
         a Cardiac monitor
         b Pulse oximetry low
         c End tidal CO₂ high
D Management of anaphylaxis
   1 Remove offending agent (i.e. remove stinger)
   2 Airway and ventilation
      a Positioning
      b Oxygen
      c Assist ventilation
      d Advanced airway
   3 Circulation
      a Venous access
      b Fluid resuscitation
   4 Pharmacological
      a Oxygen
      b Epinephrine – main stay of treatment
         i Bronchodilator
         ii Decrease vascular permeability
      c Antihistamine
      d Anti-inflammatory/ immunosuppressant
      e Vasopressor
   5 Psychological support
   6 Transport considerations

E Management of allergic reaction
   1 Without dyspnea
      a Antihistamine
   2 With dyspnea
      a Oxygen
      b Subcutaneous epinephrine
      c Antihistamine

II Near-Drowning
A Definition
   1 Submersion episode with at least transient recovery

B Pathophysiology
   1 Wet versus dry drownings
      a Fluid in posterior oropharynx stimulates laryngospasm
      b Aspiration occurs after muscular relaxation
      c Suffocation occurs with or without aspiration
      d Aspiration presents as airway obstruction
   2 Fresh versus saltwater considerations
      a Despite mechanistic differences, there is no difference in metabolic result
      b No difference in out-of-hospital treatment
   3 Hypothermic considerations in near-drownings
      a Common concomitant syndrome
      b May be organ protective in cold-water near-drownings
      c Always treat hypoxia first
      d Treat all near-drowning patients for hypothermia

C Treatment
   1 Establish airway
a Conflicting recommendations regarding prophylactic abdominal thrusts
b Questionable scientific data to support prophylactic abdominal thrusts
c Ventilation
d Oxygen

2 Trauma considerations
a Immersion episode of unknown etiology warrants trauma management

3 Post-resuscitation complications
a Adult respiratory distress syndrome (ARDS) or renal failure often occur post-resuscitation
b Symptoms may not appear for 24 hours or more, post-resuscitation
c All near-drowning patients should be transported for evaluation

III General toxicology, assessment and management

A Types of toxicological emergencies
1 Unintentional poisoning
   a Dosage errors
   b Idiosyncratic reactions
   c Childhood poisoning
d Environmental exposure
e Occupational exposures
f Neglect and Abuse

2 Drug/ alcohol abuse

3 Intentional poisoning/ overdose
   a Chemical warfare
   b Assault/ homicide
c Suicide attempts

B Use of poison control centers

C Routes of absorption
1 Ingestion
2 Inhalation
3 Injection
4 Absorption

D Poisoning by ingestion
1 Examples
2 Assessment findings
3 General management considerations

E Poisoning by inhalation
1 Examples
2 Assessment findings
3 General management considerations

F Poisoning by injection
1 Examples
2 Assessment findings
3 General management considerations

G Poisoning by absorption
1 Examples

4 Pathophysiology of long term alcohol abuse
   a End organ damage
   b Malnutrition
   c Withdrawal syndrome
5 Assessment findings

I Toxic syndromes
1 Cholinergics
   a Common causative agents
      i Pesticides (organophosphates / carbamates)
      ii Nerve agents (sarin / Soman)
   b Assessment findings
      i Headache
      ii Dizziness
      iii Weakness
      iv Nausea
      v SLUDGE (salivation, lacrimation, urination, defecation, GI upset, emesis)
      vi Bradycardia, wheezing, bronchoconstriction, myosis, coma, convulsions
      vii Diaphoresis, seizures
   c Management
2 Anticholinergic
   a Common causative agents
   b Assessment findings
   c Management
3 Hallucinogens
   a Common causative agents
      i lysergic acid diethylamide (LSD)
      ii phenyclicidine (PCP)
      iii Peyote
      iv mushrooms
   b Assessment findings
      i Chest pain
   c Management
4 Narcotics/ opiates
   a Common causative agents –
      i heroin
      ii morphine
      iii codeine
      iv meperidine
      v propoxyphene
   b Assessment findings
      i Euphoria
      ii Hypotension

   1  Clinical uses
   2  Common causative agents
   3  Common street names
   4  Assessment findings
   5  Management
Module IV: Trauma
NREMT PRACTICE ANALYSIS TASK ITEMS

- Perform a rapid trauma assessment
- Provide care to a patient with shock (hypoperfusion)
- Assess a patient with a head injury
- Assess a patient with a suspected spinal injury
- Provide care to a patient with a suspected spinal injury
- Provide care to a patient with a chest injury
- Provide care to a patient with an open abdominal injury

COGNITIVE OBJECTIVES

At the completion of this unit, the paramedic will be able to:

4.1 State the reasons for performing a rapid trauma assessment. (C-1) / 3-3.35
4.2 Recite examples and explain why patients should receive a rapid trauma assessment. (C-1) / 3-3.36
4.3 Apply the techniques of physical examination to the trauma patient. (C-1) / 3-3.37
4.4 Describe the areas included in the rapid trauma assessment and discuss what should be evaluated. (C-1) / 3-3.38
4.5 Differentiate cases when the rapid assessment may be altered in order to provide patient care. (C-3) / 3-3.39
4.6 Discuss the treatment plan and management of hemorrhage and shock. (C-1) / 4-2.8
4.7 Develop, execute and evaluate a treatment plan based on the field impression for the hemorrhage or shock patient. (C-3) / 4-2.44
4.8 Relate assessment findings associated with head/brain injuries to the pathophysiologic process. (C-3) / 4-5.43
4.9 Classify head injuries (mild, moderate, severe) according to assessment findings. (C-2) / 4-5.44
4.10 Relate assessment findings associated with concussion, moderate and severe diffuse axonal injury to pathophysiology. (C-3) / 4-5.49
4.11 Relate assessment findings associated with skull fracture to pathophysiology. (C-3) / 4-5.52
4.12 Relate assessment findings associated with cerebral contusion to pathophysiology. (C-3) / 4-5.55
4.13 Relate assessment findings associated with intracranial hemorrhage to pathophysiology, including:
   - Epidural
   - Subdural
   - Intracerebral
   - Subarachnoid
4.14 Integrate the pathophysiological principles to the assessment of a patient with head/brain injury. (C-3) / 4-5.63
4.15 Differentiate between the types of head/brain injuries based on the assessment and history. (C-3) / 4-5.64
4.16 Formulate a field impression for a patient with a head/brain injury based on the assessment findings. (C-3) / 4-5.65
4.17 Describe the assessment findings associated with spinal injuries. (C-1) / 4-6.6
4.18 Identify the need for rapid intervention and transport of the patient with spinal injuries.
   (C-1) / 4-6.8
4.19 Integrate the pathophysiological principles to the assessment of a patient with a spinal
   injury. (C-3) / 4-6.9
4.20 Differentiate between spinal injuries based on the assessment and history. (C-3) / 4-6.10
4.21 Formulate a field impression based on the assessment findings (spinal injuries).
   (C-3) / 4-6.11
4.22 Develop a patient management plan based on the field impression (spinal injuries).
   (C-3) / 4-6.12
4.23 Describe the assessment findings associated with traumatic spinal injuries. (C-1) / 4-6.14
4.24 Describe the management of traumatic spinal injuries. (C-1) / 4-6.15
4.25 Integrate pathophysiological principles to the assessment of a patient with a traumatic spinal
   injury. (C-3) / 4-6.16
4.26 Differentiate between traumatic and non-traumatic spinal injuries based on the assessment
   and history. (C-3) / 4-6.17
4.27 Formulate a field impression for traumatic spinal injury based on the assessment findings.
   (C-3) / 4-6.18
4.28 Develop a patient management plan for traumatic spinal injury based on the field
   impression. (C-3) / 4-6.19
4.29 Describe the assessment findings associated with non-traumatic spinal injuries.
   (C-1) / 4-6.21
4.30 Describe the management of non-traumatic spinal injuries. (C-1) / 4-6.22
4.31 Integrate pathophysiological principles to the assessment of a patient with non-traumatic
   spinal injury. (C-3) / 4-6.23
4.32 Differentiate between traumatic and non-traumatic spinal injuries based on the assessment
   and history. (C-3) / 4-6.24
4.33 Formulate a field impression for non-traumatic spinal injury based on the assessment
   findings. (C-3) / 4-6.25
4.34 Develop a patient management plan for non-traumatic spinal injury based on the field
   impression. (C-3) / 4-6.26
4.35 Discuss the management of thoracic injuries. (C-1) / 4-7.7
4.36 Identify the need for rapid intervention and transport of the patient with chest wall injuries.
   (C-1) / 4-7.11
4.37 Discuss the management of chest wall injuries. (C-1) / 4-7.12
4.38 Discuss the management of lung injuries. (C-1) / 4-7.15
4.39 Identify the need for rapid intervention and transport of the patient with lung injuries.
   (C-1) / 4-7.16
4.40 Discuss the management of myocardial injuries. (C-1) / 4-7.19
4.41 Identify the need for rapid intervention and transport of the patient with myocardial injuries.
   (C-1) / 4-7.20
4.42 Discuss the management of vascular injuries. (C-1) / 4-7.23
4.43 Identify the need for rapid intervention and transport of the patient with vascular injuries.
   (C-1) / 4-7.24
4.44 Discuss the management of diaphragmatic injuries. (C-1) / 4-7.27
4.45 Identify the need for rapid intervention and transport of the patient with diaphragmatic
   injuries. (C-1) / 4-7.28
4.46 Discuss the management of esophageal injuries. (C-1) / 4-7.31
Module IV: Trauma

4.47 Identify the need for rapid intervention and transport of the patient with esophageal injuries.
   (C-1) / 4-7.32

4.48 Discuss the management of tracheo-bronchial injuries. (C-1) / 4-7.35

4.49 Identify the need for rapid intervention and transport of the patient with tracheo-bronchial
   injuries. (C-1) / 4-7.36

4.50 Discuss the management of traumatic asphyxia. (C-1) / 4-7.39

4.51 Identify the need for rapid intervention and transport of the patient with traumatic asphyxia.
   (C-1) / 4-7.40

4.52 Develop a patient management plan based on the field impression (thoracic injuries).
   (C-3) / 4-7.44

4.53 Describe the management of abdominal injuries. (C-1) / 4-8.8

4.54 Develop a patient management plan for patients with abdominal trauma based on the field
   impression. (C-3) / 4-8.12

4.55 Formulate a field impression based upon the assessment findings for a patient with
   abdominal injuries. (C-3) / 4-8.36

4.56 Develop a patient management plan for a patient with abdominal injuries, based upon field
   impression. (C-3) / 4-8.37

PSYCHOMOTOR OBJECTIVES

At the completion of this unit, the paramedic will be able to:

4.57 Using the techniques of physical examination, demonstrate the assessment of a trauma
   patient. (P-2) / 3-3.77

4.58 Demonstrate the rapid trauma assessment used to assess a patient based on mechanism of
   injury. (P-2) / 3-3.78

4.59 Demonstrate the management of a patient with signs and symptoms of hemorrhagic shock.
   (P-2) / 4-2.46

4.60 Demonstrate the management of a patient with signs and symptoms of compensated
   hemorrhagic shock. (P-2) / 4-2.48

4.61 Demonstrate the management of a patient with signs and symptoms of decompensated
   hemorrhagic shock. (P-2) / 4-2.50

4.62 Demonstrate a clinical assessment to determine the proper management modality for a
   patient with a suspected traumatic spinal injury. (P-1) / 4-6.29

4.63 Demonstrate a clinical assessment to determine the proper management modality for a
   patient with a suspected non-traumatic spinal injury. (P-1) / 4-6.30

4.64 Demonstrate immobilization of the urgent and non-urgent patient with assessment findings
   of spinal injury from the following presentations: (P-1) / 4-6.31
   • Supine
   • Prone
   • Semi-prone
   • Sitting
   • Standing

4.65 Demonstrate preferred methods for stabilization of a helmet from a potentially spine injured
   patient. 4-6.33
4.66 Demonstrate the following techniques of management for thoracic injuries: (P-1) / 4-7.50
   - Needle decompression
   - Fracture stabilization
   - Elective intubation
   - ECG monitoring
   - Oxygenation and ventilation

4.67 Demonstrate a clinical assessment to determine the proper treatment plan for a patient with suspected abdominal trauma. (P-1) / 4-8.41
Module IV: Trauma

DECLARATIVE

I  Focused history and physical exam – trauma patients
   A  Re-consider mechanism of injury
      1  Helps to identify priority patients
      2  Helps to guide the assessment
      3  Significant mechanism of injury
         a  Ejection from vehicle
         b  Death in same passenger compartment
         c  Falls > 20 feet
         d  Roll-over of vehicle
         e  High-speed vehicle collision
         f  Vehicle-pedestrian collision
         g  Motorcycle crash
         h  Unresponsive or altered mental status
         i  Penetrations of the head, chest, or abdomen
         j  Hidden injuries
            i  Seat belts
               a)  If buckled, may have produced injuries
               b)  If patient had seat belt on, it does not mean they do not have injuries
            ii  Airbags
               a)  May not be effective without seat belt
               b)  Patient can hit wheel after deflation
               c)  Lift the deployed airbag and look at the steering wheel for deformation
      4  Additional infant and child considerations
         a  Falls >10 feet
         b  Bicycle collision
         c  Vehicle in medium speed collision
   B  Perform rapid trauma physical examination on patients with significant mechanism of injury to determine life-threatening injuries
      1  In the responsive patient, symptoms should be sought before and during the trauma assessment
      2  Continue spinal stabilization
      3  Reconsider transport decision
      4  Assess mental status
      5  As you inspect and palpate, look and feel for injuries or signs of injury
      6  Examination
         a  Assess the head, inspect and palpate for injuries or signs of injury
         b  Assess the neck, inspect and palpate for injuries or signs of injury
         c  Apply cervical spinal immobilization collar (CSIC) (may use information from the head injury unit at this time)
         d  Assess the chest
         e  Assess the abdomen, inspect and palpate for injuries or signs of injury
         f  Assess the pelvis, inspect and palpate for injuries or signs of injury
         g  Assess all four extremities, inspect and palpate for injuries or signs of injury
h Roll patient with spinal precautions and assess posterior body, inspect and palpate, examining for injuries or signs of injury
i Look for medical identification devices
j Assess baseline vital signs
k Assess patient history
l Chief complaint
m History of present illness
n Past medical history
o Current health status

II Shock
A Epidemiology
B Pathophysiology
C Stages of Shock
D Assessment
E Management/ treatment plan
   1 Airway and ventilatory support
      a Ventilate and suction as necessary
      b Administer high concentration oxygen
      c Reduce increased intrathoracic pressure in tension pneumothorax
   2 Circulatory support
      a Hemorrhage control
      b Intravenous volume expanders
         i Types
            a) Isotonic solutions
            b) Hypertonic solutions
            c) Synthetic solutions
            d) Blood and blood products
            e) Experimental solutions
            f) Blood substitutes
         ii Rate of administration
            a) External hemorrhage that can be controlled
            b) External hemorrhage that can not be controlled
            c) Internal hemorrhage
         c Pneumatic anti-shock garment
            i Effects
               a) Increased arterial blood pressure above garment
               b) Increased systemic vascular resistance
               c) Immobilization of pelvis and possibly lower extremities
               d) Increased intra-abdominal pressure
            ii Mechanism
               a) Increases systemic vascular resistance through direct compression of tissues and blood vessels
               b) Negligible autotransfusion effect
            iii Indications
               a) Hypoperfusion with unstable pelvis
               b) Conditions of decreased SVR not corrected by other means
c) As approved locally, other conditions characterized by hypoperfusion with hypotension

d) Research studies

iv Contraindications
a) Advanced pregnancy (no inflation of abdominal compartment)
b) Object impaled in abdomen or evisceration (no inflation of abdominal compartment)
c) Ruptured diaphragm
d) Cardiogenic shock
e) Pulmonary edema

v Needle chest decompression of tension pneumothorax to improve impaired cardiac output

vi Recognize the need for expeditious transport of suspected cardiac tamponade for pericardiocentesis

3 Pharmacological interventions
a Hypovolemic shock  
   i Volume expanders

b Cardiogenic shock  
   i Volume expanders
   ii Positive cardiac inotropes
   iii Vasoconstrictor
   iv Rate altering medications

c Distributive shock  
   i Volume expanders
   ii Positive cardiac inotropes
   iii Vasoconstrictin
   iv PASG

d Obstructive shock  
   i Volume expanders

e Spinal shock  
   i Volume expanders

4 Psychological support/communication strategies

5 Transport considerations
a Indications for rapid transport
b Indications for transport to a trauma center
c Considerations for air medical transportation

III Head trauma

A Review of anatomy and physiology
B Mechanisms of injury
C General categories of injury
D Causes of brain injury
E Head injury – broad and inclusive
F Brain injury
G Pathophysiology of head/brain injury
   1 Increased intracranial pressure
   2 Mechanism
   3 Assessment
Module IV: Trauma

IV-8

2001 EMT-Paramedic Refresher

Pressure exerted downward

i Cerebral cortices and/ or reticular activating system effected
   a) Altered level of consciousness – amnesia of event, confusion, disorientation, lethargy or combativeness, focal deficit or weakness

ii Hypothalamus – vomiting

iii Brain stem
   a) Blood pressure elevates to maintain MAP and thus CPP
   b) Vagal nerve pressure – bradycardia
   c) Respiratory centers – irregular respirations or tachypnea
   d) Oculomotor nerve paralysis – unequal/ unreactive pupils
   e) Posturing – flexion/ extension

iv Seizures – depending on location of injury

Levels of increasing ICP

i Cerebral cortex and upper brain stem involved
   a) BP rising and pulse rate begins slowing
   b) Pupils still reactive
   c) Cheyne-Stokes respirations
   d) Initially try to localize and remove painful stimuli
   e) All effects reversible at this stage

ii Middle brain stem involved
   a) Wide pulse pressure and bradycardia
   b) Pupils nonreactive or sluggish
   c) Central neurogenic hyperventilation (CNH)
   d) Extension
   e) Few patients function normally from this level

iii Lower portion of brain stem involved/ medulla
   a) Pupil blown – same side as injury
   b) Respirations ataxic (erratic, no rhythm) or absent
   c) Flaccid
   d) Labile pulse rate, irregular often great pulse swings in rate
   e) QRS, S-T and T wave changes
   f) Decreased BP, often labile BP
   g) Not considered survivable

Glasgow coma scale – method to assess level of consciousness

i Three independent measurements
   a) Eye opening
   b) Verbal response
   c) Motor response

ii Numerical score – 3 to 15

iii Head injury classified according to score
   a) Mild – 13 to 15
   b) Moderate – 8 to 12
   c) Severe – < 8
   d) Vital signs
e) Pupil size and reaction  
f) Presence of focal deficit  
g) History of unconsciousness or amnesia of event  

iv Management

H Specific Injuries – diffuse axonal injury and focal injuries

1 Diffuse axonal injury – shearing, stretching or tearing of nerve fibers with subsequent axonal damage
a Concussion (mild DAI) – physiologic neurologic dysfunction without substantial anatomic disruption which results in transient episode of neuronal dysfunction with rapid return to normal neurologic activity
i Epidemiology  
ii Assessment – confusion, disorientation, amnesia of the event  
iii Management

2 Moderate DAI – shearing, stretching or tearing results in minute petechial bruising of brain tissue, brain stem and reticular activating system may be involved leading to unconsciousness
a Epidemiology  
b Assessment – may result in immediate unconsciousness or persistent confusion, disorientation and amnesia of the event extending to amnesia of moment-to-moment events; may have focal deficit; residual cognitive (inability to concentrate), psychologic (frequent periods of anxiety, uncharacteristic mood swings) and sensorimotor deficits (sense of smell altered) may persist  
c Management

3 Severe DAI – formerly called brain stem injury, involves severe mechanical disruption of many axons in both cerebral hemispheres and extending to the brainstem
a Epidemiology  
b Assessment – unconsciousness for prolonged period, posturing common, other signs of increased ICP occur depending on various degrees of damage  
c Management

4 Focal injury
a Skull fracture – the significance is in the amount of force involved  
i Epidemiology  
ii Types
a) Linear (80% of all skull fractures)  
b) Depressed  
c) Basilar  
d) Open skull fractures  
iii Assessment – linear fractures may be missed, depressed and open skull fractures usually found on palpation of head, use balls of fingers to palpate  
a) Airway patency and breathing adequacy a priority  
b) Vomiting and inadequate respirations are common  
c) Assess for signs and symptoms of increased intracranial pressure  
iv Management
b  Cerebral contusion – a focal brain injury in which brain tissue is bruised and damaged in a local area; may occur at both the area of direct impact (coup) and/or on the opposite side (contrecoup) of impact
   i  Epidemiology
   ii Assessment
      a)  Airway patency and breathing adequacy a priority
      b)  Alteration in level of consciousness
      c)  May complain of progressive headache and/or photophobia
      d)  May be unable to lay down memory – repetitive phrases common
      e)  Assess for signs and symptoms of increased intracranial pressure
   iii Management

c  Intracranial hemorrhage
   i  Types
      a)  Epidural
      b)  Subdural
      c)  Intracerebral
      d)  Subarachnoid
   ii Epidemiology
   iii Assessment
      a)  May be impossible to tell which type of hematoma is present
      b)  More important to recognize the presence of brain injury
      c)  Signs/ symptoms of increasing intracranial pressure
      d)  Signs/ symptoms of neurological deficit
      e)  Early signs and symptoms of alterations in level of consciousness
      f)  Signs of brain irritation – change in personality, irritability, lethargy, confusion, repeating words or phrases, changes in consciousness, paralysis of one side of the body, seizures
      g)  GCS
   iv Management

IV  Spinal trauma
   A  Introduction
   B  Incidences
   C  Morbidity and mortality
   D  Traditional spinal assessments/ criteria
      1  Based upon mechanism of injury (MOI)
      2  Past emphasis for spinal immobilization considerations
         a  Unconscious accident victims
         b  Conscious accident victims checked for SCI prior to movement
         c  Any patient with a “motion” injury
3 Lack of clear clinical guidelines or specific criteria to evaluate for SCI
4 Signs which may indicate SCI
   a Pain
   b Tenderness
   c Painful movement
   d Deformity
   e Cuts/ bruises (over spinal area)
   f Paralysis
   g Paresthesias
   h Paresis (weakness)
   i Shock
   j Priapism
5 Not always practical to immobilize every “motion” injury
6 Most suspected injuries were moved to a normal anatomical position
   a Lying flat on a spine board
   b No exclusion criteria used for moving patients to an anatomical position
7 Need to have clear criteria to assess for the presence of SCI
E General spinal anatomy and physiology review
F General assessment of spinal injuries
1 Determine mechanism of injury/ nature or injury
   a Positive MOI
      i Always requires full spinal immobilization
         a) High speed motor vehicle crash(es)
         b) Falls greater than three times patient’s height
         c) Violent situations occurring near the spine
         d) Sports injuries
         e) Other high impact situations
      ii Some medical directors may allow field personnel to not immobilize patients with MOI but without signs and/ or symptoms of a SCI
         a) Based on assessment
   b Negative MOI
      i Forces or impact involved does not suggest a potential spinal injury
      ii Does not require spinal immobilization
         a) Examples
   c Uncertain MOI
      i Unclear or uncertainty regarding the impact or forces
      ii Clinical criteria used for a basis of whether to employ spinal immobilization
         a) Examples
   d Clinical criteria versus mechanism of injury
      i Initial management
         a) Based solely upon MOI
      ii Positive MOI
         a) Spine immobilization
      iii Negative MOI
         a) Without signs or symptoms

IV-11
Uncertain MOI
a) Need for further clinical assessment and evaluation

In some non-traumatic spinal conditions immobilization may be necessary/indicated

vi Altered LOC or unconsciousness requires spine stabilization

Assessment of uncertain MOIs
1 Specific clinical criteria
   a Necessary to assess when electing not to immobilize a trauma patient
   b Begins with patient reliability
      i Continually reassessed during specific exam
   c If specific criteria cannot be clearly satisfied; complete spine immobilization undertaken
   d Positive MOI always equals spine immobilization
      i This specific assessment may still be used to determine level of injury

2 Specific criteria
   a Prevent motion of the spine by assistant maintaining stabilization throughout the exam
   b Reliable patients/ exam
      i In order for assessments of pain, tenderness, motor, and sensory function to be accurate the patient must be reliable
      ii Patient must be
         a) Calm
         b) Cooperative
         c) Sober
         d) Alert and oriented
      iii Unreliable patient defined
         a) Acute stress reaction
         b) Brain injury
         c) Intoxication
         d) Abnormal mental status
         e) Distracting injuries
         f) Communication problems
   iv Unreliable indicators present
      a) Full spinal immobilization indicated
   c Assess for spinal pain
      i Patient is asked about
         a) Any related spinal pain
         b) Signs
         c) Symptoms
      ii May be poorly localized
      iii Might not feel directly over the spinous process
   iv Pain with active movement of head and neck
      a) Patient is asked to slowly move their head and neck
      b) If any pain occurs
   d Assess for spine tenderness
      i Palpate over each of the spinous processes of the vertebra
      ii Begin at the neck and work towards the pelvis
Module IV: Trauma

 iii May be beneficial to palpate back up from the pelvis to the neck

e Upper extremity neurological function assessment
   i Motor function
      a) Finger abduction/ adduction
      b) Finger/ hand extension
   ii Sensory function
      a) Pain sensation

f Lower extremity neurological function assessment
   i Motor function
      a) Foot plantar flexion
      b) Foot/ great toe dorsiflexion
   ii Sensory function
      a) Pain sensation

g General motor function assessment
   i Tests nerve roots at both cervical and lumbar/sacral spine levels
   ii Check two sets of nerve roots at each level as well as left and right sides
   iii Able to determine most clinical patterns of SCI
   iv Motor exams can be completed even if local injury exists
      a) If exam cannot be completed due to local injury entire exam is unreliable

h Sensory function assessment
   i Test (exam) sensory
      a) At cervical and lumbar/ sacral spine levels
   ii Sensory exam will detect clinical patterns of SCI
   iii Any signs or symptoms of abnormal sensation
      a) Spinal immobilization indicated

H General management of spinal injuries
  1 Principles of spinal immobilization
     a Primary goal is to prevent further injury
     b Treat spine as a long bone with a joint at either end (head and pelvis)
     c 15% of secondary spinal injuries are preventable with proper immobilization
     d Always use “complete” spine immobilization
        i Impossible to isolate and splint specific injury site
     e Spine stabilization begins in the initial assessment
        i Continues until the spine is completely immobilized on a long backboard
     f Head and neck should be placed in a neutral, in-line position unless contraindicated
        i Neutral positioning allows for the most space for the cord
           a) Reducing cord hypoxia
           b) Reducing excess pressure
        ii Most stable position for the spinal column
           a) Reduces instability

IV-13
Module IV: Trauma

2 Spinal stabilization/immobilization
   a Systematic approach
      i Cervical immobilization
         a) Manual
         b) Rigid collar
      ii Interim immobilization device
         a) When indicated (vest type mobilization device, short backboard)
         b) Movement of a stable patient from a seated position to a long backboard
      iii Long backboard
      iv Full body vacuum splints
   v Padding (body shims)
      a) Use to maintain anatomical position
      b) Limits movement of patient
      c) Fill all voids
      d) Pillows
      e) Towels
      f) Blankets
   vi Straps
      a) Sufficient to immobilize to the long backboard
   vii Cervical immobilization device
      a) Commercial
      b) Tape
      c) Blanket roll
      d) Pillows
   b Helmeted patients
      i Special assessment needs for patients wearing helmets
      ii Indications for leaving the helmet in place
      iii Indications for helmet removal
      iv Types of helmets
   v General guidelines for helmet removal

V Thoracic trauma
A General Introduction
1 Epidemiology
2 Mechanism of injury
3 Anatomy and physiology review of the thorax
4 Pathophysiology
5 Assessment findings
6 Management
   a Airway and ventilation
      i Oxygen therapy
      ii Endotracheal intubation
      iii Needle cricothyrotomy
      iv Surgical cricothyrotomy
   v Positive pressure ventilation
   vi Occlude open wounds
   vii Stabilize chest wall
Module IV: Trauma

b Circulation
   i Manage cardiac dysrhythmias
   ii Intravenous access
c Pharmacologic
   i Analgesics
   ii Antiarrhythmics
d Non-pharmacologic
   i Needle thoracostomy
   ii Tube thoracostomy – in hospital management
   iii Pericardiocentesis – in hospital management
e Transport considerations
   i Appropriate mode
   ii Appropriate facility

B Chest wall injuries

1 Rib fractures
   a Epidemiology
   b Anatomy and physiology review
   c Pathophysiology
d Assessment findings
e Management
   i Airway and ventilation
      a) Oxygen therapy
      b) Positive pressure ventilation
      c) Encourage coughing and deep breathing
   ii Pharmacological
      a) Analgesics
   iii Non-pharmacological
      a) Splint – but avoid circumferential splinting
   iv Transport consideration
      a) Appropriate mode
      b) Appropriate facility
   v Psychological support/ communication strategies

2 Flail segment
   a Epidemiology
   b Pathophysiology
c Assessment findings
d Management
   i Airway and ventilation
      a) Positive pressure ventilation may be needed
      b) Oxygen (high concentration)
      c) Evaluate the need for endotracheal intubation
      d) Stabilize flail segment (may be controversial locally)
      e) Positive end expiratory pressure (PEEP)
   ii Circulation
      a) Restrict fluids
   iii Pharmacologic
      a) Analgesics
iv Non-pharmacologic
   a) Positioning
   b) Endotracheal intubation and positive pressure
      ventilation for internal splinting effect

v Transport considerations
   a) Appropriate mode
   b) Appropriate facility

vi Psychological support/communication strategies

3 Sternal fracture
   a Epidemiology
   b Pathophysiology
   c Assessment findings
   d Management
      i Airway and ventilation
      ii Circulation
         a) Restrict fluids if pulmonary contusion is suspected
      iii Pharmacologic
         a) Analgesics
   iv Non-pharmacologic
      a) Allow chest wall self-splinting

v Transport considerations
   a) Appropriate mode
   b) Appropriate facility

vi Psychological support/communication strategies

C Injury to the lung

1 Simple pneumothorax
   a Epidemiology
   b Pathophysiology
   c Assessment findings
   d Management
      i Airway and ventilation
         a) Positive pressure ventilation if necessary
         b) Monitor for development of tension pneumothorax
      ii Non-pharmacologic
         a) Needle thoracostomy
      iii Transport consideration
         a) Appropriate mode
         b) Appropriate facility
   e Psychological support/communication strategies

2 Open pneumothorax
   a Epidemiology
   b Pathophysiology
   c Assessment findings
   d Management
      i Airway and ventilation
         a) Positive pressure ventilation if necessary
         b) Monitor for development of tension pneumothorax
Module IV: Trauma

ii Non-pharmacologic
   a) Occlude open wound
   b) Tube thoracostomy – in hospital management

e Transport consideration
   i Appropriate mode
   ii Appropriate facility

f Psychological support/ communication strategies

3 Tension pneumothorax
a Epidemiology
b Pathophysiology
c Assessment findings
d Management
   i Airway and ventilation
      a) Positive pressure ventilation if necessary
   ii Circulation
      a) Relieve tension pneumothorax to improve cardiac output
   iii Non-pharmacologic
      a) Occlude open wound
      b) Needle thoracentesis
      c) Tube thoracostomy – in hospital management
   iv Transport considerations
      a) Appropriate mode
      b) Appropriate facility
   v Psychological support/ communication strategies

4 Hemothorax
a Epidemiology
b Pathophysiology
c Assessment findings
d Management
   i Airway and ventilation
      a) Positive pressure ventilation if necessary
   ii Circulation
      a) Re-expand the affected lung to reduce bleeding
   iii Non-pharmacological
      a) Needle chest decompression
      b) Tube thoracostomy – in hospital management
   iv Transport considerations
      a) Appropriate mode
      b) Appropriate facility
   v Psychological support/ communication strategies

5 Hemopneumothorax
a Epidemiology
b Pathophysiology
c Assessment findings
d Management
   i Management is the same as a hemothorax
6 Pulmonary contusion
   a Epidemiology
   b Pathophysiology
   c Assessment findings
   d Management
      i Airway and ventilation
         a) Positive pressure ventilation if necessary
      ii Circulation
         a) Restrict intravenous fluids (use caution restricting fluids in hypovolemic patients)
      iii Transport considerations
         a) Appropriate mode
         b) Appropriate facility
      iv Psychological support/ communication strategies

D Myocardial injuries
1 Pericardial tamponade
   a Epidemiology
   b Anatomy and physiology
   c Pathophysiology
   d Assessment findings
   e Management
      i Airway and ventilation
      ii Circulation
         a) Fluid challenge
      iii Non-pharmacological
         a) Pericardiocentesis – in hospital management
      iv Transport considerations
         a) Appropriate mode
         b) Appropriate facility
      v Psychological support/ communication strategies

2 Myocardial contusion (blunt myocardial injury)
   a Epidemiology
   b Anatomy and physiology
   c Pathophysiology
   d Assessment findings
   e Management
      i Airway and ventilation
         a) Oxygen therapy
      ii Circulation
         a) Intravenous fluid volume
      iii Pharmacological
         a) Antiarrhythmics
         b) Vasopressors
      iv Transport considerations
         a) Appropriate mode
         b) Appropriate facility
      v Psychological support/ communication strategies
3 Myocardial rupture  
   a Epidemiology  
   b Anatomy and physiology  
   c Pathophysiology  
   d Assessment findings  
   e Management is supportive

E Vascular injuries  
1 Aortic dissection/ rupture  
   a Epidemiology  
   b Anatomy and physiology  
   c Pathophysiology  
   d Assessment findings  
   e Management  
      i Airway and ventilation  
      ii Circulation  
         a) Do not over hydrate  
      iii Transport considerations  
         a) Appropriate mode  
         b) Appropriate facility  
   iv Psychological support/ communication strategies

2 Penetrating wounds of the great vessels  
   a Epidemiology  
   b Anatomy and physiology  
   c Pathophysiology  
   d Assessment findings  
   e Management  
      i Manage hypovolemia  
      a) PASG not recommended  
      ii Relief of tamponade if present  
      iii Expeditious transport

F Other thorax injuries  
1 Diaphragmatic injury  
   a Epidemiology  
   b Pathophysiology  
   c Assessment  
   d Management  
      i Airway and ventilation  
      a) Positive pressure ventilation if necessary  
      b) Caution IPPB may worsen the injury  
      ii Non-pharmacologic  
      a) Do not place patient in Trendelenburg position  
      iii Transport consideration  
      a) Appropriate mode  
      b) Appropriate facility  
      iv Psychological support/ communication strategies

2 Esophageal injury  
   a Epidemiology  
   b Pathophysiology  
   c Assessment
d Management
   i Airway and ventilation
   ii Transport consideration
      a) Appropriate mode
      b) Appropriate facility
   iii Psychological support/communication strategies

3 Tracheo-bronchial injuries
a Epidemiology
b Pathophysiology
c Assessment
d Management
   i Airway and ventilation
   ii Circulation
   iii Transport consideration
      a) Appropriate mode
      b) Appropriate facility

4 Traumatic asphyxia
a Epidemiology
b Pathophysiology
c Assessment
d Management
   i Airway and ventilation
   ii Circulation
      a) Expect hypotension once compression is released
   iii Pharmacological
      a) Sodium bicarbonate should be guided by ABGs in hospital
   iv Transport considerations
      a) Appropriate mode
      b) Appropriate facility

VI Abdominal trauma
A General introduction
   1 Epidemiology
   2 Anatomy review
   3 Mechanism of injury review
B General system pathophysiology, assessment, and management
   1 Pathophysiology of abdominal injuries
   2 Assessment
   3 Management/treatment plan
      a Surgical intervention only effective therapy
      b No definitive therapy possible out-of-hospital
      c Rapid evaluation
      d Initiation of shock resuscitation
      e Rapid packaging and transport to nearest appropriate facility
         i Facility must have immediate surgical capability
         ii Rapid transport
            a) Defeated if hospital cannot provide immediate surgical intervention
### Specific injuries

#### 1 Solid organ injuries

**a** Overview

- i Epidemiology
- ii Prevention strategies
- iii Anatomy and physiology review
- iv Pathophysiology
- v Assessment
- vi Management/treatment plan
  - a) Airway support
  - b) Breathing support
  - c) Circulatory support
  - d) Patient packaging
  - e) Transport
  - f) Psychological support/communications strategies

**b** Liver injuries

- i Morbidity and mortality
  - a) Result of blood loss
- ii Injuries result of
  - a) Blunt trauma
  - b) Penetrating trauma

**c** Splenic injuries

- i Most frequently injured organ
  - a) Blunt trauma
  - b) Commonly associated with other intra abdominal injuries
  - c) May present with left shoulder pain

**d** Kidney injuries

- i Often presents with hematuria
- ii Back pain

**e** Pancreas

- i Most common with penetrating injuries
Module IV: Trauma

ii May also occur as a result of pancreas being compressed against vertebral column by
   a) Steering wheels
   b) Handle bars
   c) Other structures stronger than the pancreas
iii Products of pancreas have an irritation effect on peritoneum
iv Auto-digestion of tissue

f Diaphragm
i Injury often insidious
ii Herniation of abdominal contents into chest may occur

2 Hollow organ injuries
a Overview
   i Epidemiology
   ii Prevention strategies
   iii Anatomy and physiology review
   iv Pathophysiology
   v Assessment
   vi Management/treatment plan
      a) Airway support
      b) Breathing support
      c) Circulatory support
      d) Patient packaging
      e) Transport
      f) Psychological support/communications strategies

b Small and large intestines
   i Most often injured as a result of penetrating injuries
   ii Can occur with deceleration injuries

c Stomach
   i Most often injured as a result of
      a) Blunt trauma
      b) Full stomach prior to incident increases risk of injury

d Duodenum
   i Most often injured as a result of
      a) Blunt trauma
   ii Recognition often delayed

e Bladder
   i Most often injured as a result of
      a) Blunt trauma
      b) Full bladder prior to incident may increase risk of injury
   ii Associated with pelvic injury

3 Abdominal vascular injuries
a Overview
   i Epidemiology
   ii Prevention strategies
   iii Anatomy and physiology review
   iv Pathophysiology
   v Assessment
vi Management/ treatment plan
a) Airway support
b) Breathing support
c) Circulatory support
d) Patient packaging
e) Transport
f) Psychological support/ communications strategies

4 Other related abdominal injuries
a Eviscerations
i Epidemiology
ii Prevention strategies
iii Anatomy and physiology review
iv Pathophysiology
v Assessment
vi Management/ treatment plan
a) Airway support
b) Breathing support
c) Circulatory support
d) Patient packaging
e) Transport
f) Psychological support
Module V: Pediatrics
NREMT PRACTICE ANALYSIS TASK ITEMS

- Assess an infant or child w/ cardiac arrest
- Provide care to an infant or child w/ cardiac arrest
- Assess an infant or child w/ respiratory distress
- Provide care to an infant or child in respiratory distress
- Assess an infant or child with shock (hypoperfusion)
- Provide care to an infant or child with shock (hypoperfusion)
- Assess an infant or child with trauma
- Provide care to an infant or child with trauma

COGNITIVE OBJECTIVES

At the completion of this unit, the paramedic will be able to:

5.1 Describe techniques for successful assessment of infants and children. (C-1) / 6-2.8
5.2 Describe techniques for successful treatment of infants and children. (C-1) / 6-2.9
5.3 Discuss the appropriate equipment utilized to obtain pediatric vital signs. (C-1) / 6-2.14
5.4 Determine appropriate airway adjuncts for infants and children. (C-1) 6-2.15
5.5 Discuss complications of improper utilization of airway adjuncts with infants and children. (C-1) 6-2.16
5.6 Discuss appropriate ventilation devices for infants and children. (C-1) 6-2.17
5.7 Discuss complications of improper utilization of ventilation devices with infants & children. (C-1) 6-2.18
5.8 Discuss appropriate endotracheal intubation equipment for infants and children. (C-1) / 6-2.19
5.9 Identify complications of improper endotracheal intubation procedure in infants and children. (C-1) / 6-2.20
5.10 List the indications and methods for gastric decompression for infants and children. (C-1) / 6-2.21
5.11 Differentiate between upper airway obstruction and lower airway disease. (C-3) / 6-2.25
5.12 Describe the general approach to the treatment of children with respiratory distress, failure, or arrest from upper airway obstruction or lower airway disease. (C-3) / 6-2.26
5.13 Discuss the common causes of hypoperfusion in infants and children. (C-1) / 6-2.27
5.14 Evaluate the severity of hypoperfusion in infants and children. (C-3) / 6-2.28
5.15 Identify the major classifications of pediatric cardiac rhythms. (C-1) 6-2.29
5.16 Discuss the primary etiologies of cardiopulmonary arrest in infants and children. (C-1) / 6-2.30
5.17 Discuss age appropriate vascular access sites for infants and children. (C-1) 6-2.31
5.18 Discuss the appropriate equipment for vascular access in infants and children. (C-1) 6-2.32
5.19 Identify complications of vascular access for infants and children. (C-1) 6-2.33
5.20 Describe the primary etiologies of altered level of consciousness in infants and children. (C-1) 6-2.34
5.21 Identify common lethal mechanisms of injury in infants and children. (C-1) / 6-2.35
5.22 Discuss anatomical features of children that predispose or protect them from certain injuries. (C-1) / 6-2.36
5.23 Describe aspects of infant and children airway management that are affected by potential cervical spine injury. (C-1) / 6-2.37
5.24 Identify infant and child trauma patients who require spinal immobilization. (C-1) / 6-2.38
Module V: Pediatrics

5.25 Discuss fluid management and shock treatment for infant and child trauma patient. (C-1) / 6-2.39
5.26 Discuss the parent/ caregiver responses to the death of an infant or child. (C-1) / 6-2.44
5.27 Discuss basic life support (CPR) guidelines for infants and children. (C-1) / 6-2.47
5.28 Identify appropriate parameters for performing infant and child CPR. (C-1) / 6-2.48
5.29 Integrate advanced life support skills with basic cardiac life support for infants and children. (C-3) / 6-2.49
5.30 Discuss the indications, dosage, route of administration and special considerations for medication administration in infants and children. (C-1) / 6-2.50
5.31 Discuss appropriate transport guidelines for infants and children. (C-1) / 6-2.51
5.32 Discuss appropriate receiving facilities for low and high risk infants and children. (C-1) / 6-2.52
5.33 Describe the epidemiology, including the incidence, morbidity/ mortality, risk factors and prevention strategies for respiratory distress/ failure in infants and children. (C-1) / 6-2.53
5.34 Discuss the pathophysiology of respiratory distress/ failure in infants and children. (C-1) / 6-2.53
5.35 Discuss the assessment findings associated with respiratory distress/ failure in infants and children. (C-1) / 6-2.55
5.36 Discuss the management/ treatment plan for respiratory distress/ failure in infants and children. (C-1) / 6-2.56
5.37 Describe the epidemiology, including the incidence, morbidity/ mortality, risk factors and prevention strategies for hypoperfusion in infants and children. (C-1) / 6-2.57
5.38 Discuss the pathophysiology of hypoperfusion in infants and children. (C-1) / 6-2.58
5.39 Discuss the assessment findings associated with hypoperfusion in infants and children. (C-1) / 6-2.59
5.40 Discuss the management/ treatment plan for hypoperfusion in infants and children. (C-1) / 6-2.60
5.41 Discuss the assessment findings associated with cardiac dysrhythmias in infants and children. (C-1) / 6-2.63
5.42 Discuss the management/ treatment plan for cardiac dysrhythmias in infants and children. (C-1) / 6-2.64
5.43 Describe the epidemiology, including the incidence, morbidity/ mortality, risk factors and prevention strategies for trauma in infants and children. (C-1) / 6-2.69
5.44 Discuss the pathophysiology of trauma in infants and children. (C-1) / 6-2.70
5.45 Discuss the assessment findings associated with trauma in infants and children. (C-1) / 6-2.71
5.46 Discuss the management/ treatment plan for trauma in infants and children. (C-1) / 6-2.72

**PSYCHOMOTOR OBJECTIVES**

At the completion of this unit, the paramedic will be able to:

5.47 Demonstrate the appropriate approach for treating infants and children. (P-2) / 6-2.91
5.48 Demonstrate appropriate intervention techniques with families of acutely ill or injured infants and children. (P-2) / 6-2.92
5.49 Demonstrate an appropriate assessment for different developmental age groups. (P-2) / 6-2.93
5.50 Demonstrate an appropriate technique for measuring pediatric vital signs. (P-2) / 6-2.93
5.51 Demonstrate the use of a length-based resuscitation device for determining equipment sizes, drug doses and other pertinent information for a pediatric patient. (P-2) / 6-2.95
5.52 Demonstrate the appropriate approach for treating infants and children with respiratory distress, failure, and arrest. (P-2) / 6-2.96
5.53 Demonstrate proper technique for administering blow-by oxygen to infants and children. (P-2) / 6-2.97
5.54 Demonstrate the proper utilization of a pediatric non-rebreather oxygen mask. (P-2) / 6-2.98
5.55 Demonstrate proper technique for suctioning of infants and children. (P-2) / 6-2.99
5.56 Demonstrate appropriate use of airway adjuncts with infants and children. (P-2) / 6-2.100
5.57 Demonstrate appropriate use of ventilation devices for infants and children. (P-2) 6-2.101
5.58 Demonstrate endotracheal intubation procedures in infants and children. (P-2) / 6-2.102
5.59 Demonstrate appropriate treatment/management of intubation complications for infants and children. (P-2) / 6-2.103
5.60 Demonstrate appropriate needle cricothyroidotomy in infants and children. (P-2) / 6-2.104
5.61 Demonstrate proper placement of a gastric tube in infants and children. (P-2) / 6-2.105
5.62 Demonstrate an appropriate technique for insertion of peripheral intravenous catheters for infants and children. (P-2) / 6-2.106
5.63 Demonstrate an appropriate technique for administration of intramuscular, inhalation, subcutaneous, rectal, endotracheal and oral medication for infants and children. (P-2) / 6-2.106
5.64 Demonstrate an appropriate technique for insertion of an intraosseous line for infants and children. (P-2) / 6-2.108
5.65 Demonstrate appropriate interventions for infants and children with a partially obstructed airway. (P-2) / 6-2.109
5.66 Demonstrate age appropriate basic airway clearing maneuvers for infants and children with a completely obstructed airway. (P-2) / 6-2.110
5.67 Demonstrate proper technique for direct laryngoscopy and foreign body retrieval in infants and children with a completely obstructed airway. (P-2) / 6-2.111
5.68 Demonstrate appropriate airway and breathing control maneuvers for infant and child trauma patients. (P-2) /
5.69 Demonstrate appropriate treatment of infants and children requiring advanced airway and breathing control. (P-2) / 6-2.113
5.70 Demonstrate appropriate immobilization techniques for infant and child trauma patients. (P-2) / 6-2.114
5.71 Demonstrate treatment of infants and children with head injuries. (P-2) / 6-2.115
5.72 Demonstrate appropriate treatment of infants and children with chest injuries. (P-2) / 6-2.116
5.73 Demonstrate appropriate treatment of infants and children with abdominal injuries. (P-2) / 6-2.117
5.74 Demonstrate appropriate treatment of infants and children with extremity injuries. (P-2) / 6-2.118
5.75 Demonstrate appropriate treatment of infants and children with burns. (P-2) / 6-2.119
5.76 Demonstrate appropriate parent/caregiver interviewing techniques for infant and child death situations. (P-2) / 6-2.120
5.77 Demonstrate proper infant CPR. (P-2) / 6-2.121
5.78 Demonstrate proper child CPR. (P-2) / 6-2.122
5.79 Demonstrate proper techniques for performing infant and child defibrillation and synchronized cardioversion. (P-2) / 6-2.123
DECLARATIVE

I  Assessment
   A  General considerations
      1  Many components of the initial patient evaluation can be done by observing
         the patient. Utilize the parent/guardian to assist in making the infant or child
         more comfortable as appropriate.
      2  Interacting with parents and family
         a  Normal responses to acute illness and injury
         b  Parent/guardian and child interaction
         c  Intervention techniques
   B  Physical exam
      1  Scene survey
         a  Observe the scene for hazards or potential hazards
         b  Observe the scene for mechanism of injury/illness
            i  Ingestion
               a)  ills, medicine bottles, household chemicals, etc.
            ii  Child abuse
               a)  Injury and history do not coincide, bruises not where
                   they should be for mechanism of injury, etc.
            iii  Position patient found
         c  Observe the parent/guardian/caregiver interaction with the child
            i  Do they act appropriately
            ii  Is parent/guardian/caregiver concerned
            iii  Is parent/guardian/caregiver angry
            iv  Is parent/guardian/caregiver indifferent
      2  Initial assessment
         a  General impression
            i  General impression of environment
            ii  General impression of parent/guardian and child interaction
            iii  General impression of the patient/Pediatric Assessment
                Triangle
               a)  A structure for assessing the pediatric patient
               b)  Focuses on the most valuable information for pediatric
                   patients
               c)  Used to ascertain if any life-threatening condition
                   exists
               d)  Components
                  i)  Appearance
                  ii)  Work of breathing
                  iii)  Circulation
            iv  Initial triage decisions
               a)  Urgent – proceed with rapid ABC assessment, treatment and transport
               b)  Non urgent – proceed with focused history, detailed
                  physical exam after initial assessment
         b  Vital functions
            i  Determine level of consciousness
a) AVPU scale
   i) Alert
   ii) Responds to verbal stimuli
   iii) Responds to painful stimuli
   iv) Unresponsive
b) Modified Glasgow Coma Scale
c) Signs of inadequate oxygenation

ii Airway
   a) Determine patency

iii Breathing
   a) Adequate chest rise and fall
   b) Use of accessory muscles
   c) Nasal flaring
d) Tachypnea
e) Bradypnea
f) Irregular breathing pattern
g) Head bobbing
h) Grunting
i) Absent breath sounds
j) Abnormal sounds

iv Circulation
   a) Pulse
      i) Central
      ii) Peripheral
      iii) Quality of pulse
   b) Blood pressure
      i) Measuring blood pressure is not necessary in children < 3 years of age
   c) Skin color
d) Active hemorrhage

v Vital signs
   a) Infant
   b) Toddler
   c) Preschool
d) School aged
e) Adolescent

3 Transition phase – Utilized to allow the infant or child to become familiar with you and your equipment
   a) Use of transition phase depends on the seriousness of the patient's condition
   b) For the conscious, non-acutely ill child
   c) For the unconscious, acutely ill child do not perform the transition phase but proceed directly to the treatment and transport

4 Focused history
   a) Approach
      i) For infant, toddler, and preschool age patient, obtain from parent/guardian
      ii) For school age and adolescent patient, most information may be obtained from the patient
iii For older adolescent patient question the patient in private regarding sexual activity, pregnancy, illicit drug and alcohol use

b Content
i Chief complaint
   a) Nature of illness/injury
   b) How long has the patient been sick/injured
   c) Presence of fever
   d) Effects on behavior
   e) Bowel/ urine habits
   f) Vomiting/ diarrhea
   g) Frequency of urination

ii Past medical history
   a) Infant or child under the care of a physician
   b) Chronic illnesses
   c) Medications
   d) Allergies

5 Detailed physical exam
a Examine all body regions
   i Head-to-toe in older child
   ii Toe-to-head in younger child
b Some or all of the following may be appropriate, depending on the situation
   i Pupils
   ii Capillary refill
      a) Normal – two seconds or less
      b) Valuable to assess on patients less than six years of age
      c) Less reliable in cold environment
      d) Blanch nailbed, base of the thumb, sole of the feet
   iii Hydration
      a) Skin turgor
      b) Sunken or flat fontanelle in an infant
      c) Presence of tears and saliva
   iv Pulse oximetry
      a) Should be utilized on any moderately injured or ill infant or child
      b) Hypothermia and shock can alter reading
   v Cardiac monitor

6 On-going exam – continually monitor the following
a Respiratory effort
b Color
c Mental status
d Pulse oximetry
e Vital signs
f Patient temperature

C General management
1 Airway management in pediatric patients
   a Basic airway management
Module V: Pediatrics

2001 EMT-Paramedic Refresher

i Manual positioning
   a) Allow medical patients to assume position of comfort
   b) Support under the torso for trauma patients less than 3 year old
   c) Occipital elevation for supine medical patients 3 years of age or older

ii Foreign body airway obstruction – basic clearing methods
   a) Infants
      i) Back blows
      ii) Chest thrusts
   b) Children
      i) Abdominal thrusts

iii Suction
   a) Avoid hypoxia
   b) Avoid upper airway stimulation
   c) Decrease suction negative pressure (100 mm/Hg) in infants

iv Oxygenation
   a) Non-rebreather mask
   b) Blow-by oxygen if mask is not tolerated
      i) Utilize the parent or guardian to deliver oxygen if (patient condition warrants
   c) Maintain proper head position

v Oropharyngeal airway
   a) Sizing
   b) Preferred method of insertion uses the tongue blade to depress the tongue and jaw

vi Nasopharyngeal airway
   a) Sizing
   b) No major differences in sizing or use compared to adults

vii Ventilation
   a) Bag size
   b) Proper mask fit
   c) Proper mask position and seal (E-C clamp)
   d) Ventilate at age appropriate rate
      (squeeze-release-release)
   e) Obtain chest rise with each breath
   f) Allow adequate time for exhalation
   g) Assess BVM ventilation
   h) Apply cricoid pressure to minimize gastric inflation and passive regurgitation

b Advanced airway management

i Foreign body airway obstruction – advanced clearing methods
   a) Direct laryngoscopy with Magill forceps
   b) Attempt intubation around foreign body
   c) Consider needle cricothyroidotomy per medical direction only as a last resort if complete upper airway obstruction is present
ii Endotracheal intubation in pediatric patients
   a) Laryngoscope and appropriate size blade
      i) Length based resuscitation tape to determine size
      ii) Straight blade is preferred
   b) Appropriate size endotracheal tube and stylet
      i) Sizing methods
      a. Length based resuscitation tape
      ii) Stylet placement
   c) Technique for pediatric intubation
   d) Depth of insertion
   e) Endotracheal tube securing device
iii Needle cricothyroidotomy in pediatric patients

2 Circulation
   a Vascular access
      i Intraosseous access in children < 6 years of age in cardiac arrest or if intravenous access fails
   b Fluid resuscitation
      i 20 ml/kg of lactated ringer’s or normal saline bolus as needed

3 Pharmacological
   a Rapid sequence intubation per medical direction

4 Non-pharmacological
   a C-spine immobilization for traumatic cause

5 Transport considerations
   a Appropriate mode
      i Transport should not be delayed to perform procedures that can be done en route
      ii Proper BLS care must be performed prior to any ALS interventions
   b Appropriate facility
      i The availability of a receiving hospital with expertise in pediatric care may improve the patient’s outcome

6 Psychological support/ communication strategies
   a Utilize the parent/ guardian to assist in making the infant or child more comfortable
   b Encourage parents to help calm the child during painful procedures
   c Infants, toddlers, preschool and school aged patients do not like to be separated from parent/ guardian
   d Infants and children have a natural fear of strangers; for stable patients, allow them to become accustomed to you before your hands-on assessment
   e Give some control of what is going to happen to the patient (which arm to have their IV)
   f When possible and practical, physically position your face at the same level as the patient’s face to facilitate communication and minimize fear
   g Use age-appropriate vocabulary
   h Keep patient warm
   i Allow child to take their favorite toy/ blanket if possible
j Permit the child to express their feelings (e.g., fear, pain, crying.)
k Let the child know that certain physical actions (e.g., hitting, biting, spitting) are not permitted

II Specific pathophysiology, assessment and management
A Respiratory compromise
1 Introduction
a Epidemiology
i Incidence
ii Morbidity/ mortality
iii Risk factors
iv Prevention strategies
b Categories of respiratory compromise
i Upper airway obstruction
ii Lower airway disease

2 Pathophysiology
a Respiratory illnesses cause respiratory compromise in airway/ lung
i Severity of respiratory compromise depends on extent of respiratory illness
ii Approach to treatment depends on severity of respiratory compromise
b Severity
i Respiratory distress
   a) Increased work of breathing
   b) Carbon dioxide tension in the blood initially decreases, then increases as condition deteriorates
   c) If uncorrected, respiratory distress leads to respiratory failure
ii Respiratory failure
   a) Inadequate ventilation or oxygenation
      i) Respiratory and circulatory systems are unable to exchange enough oxygen and carbon dioxide
   b) Carbon dioxide tension in the blood increases, leading to respiratory acidosis
   c) Very ominous condition; patient is on the verge of respiratory arrest
iii Respiratory arrest
   a) Cessation of breathing
   b) Failure to intervene will result in cardiopulmonary arrest
   c) Good outcomes can be expected with early intervention that prevents cardiopulmonary arrest

c Assessment
i Chief Complaint
ii History
iii Physical findings
   a) Signs and symptoms of respiratory distress
      i) Normal mental status => irritability or anxiety
      ii) Tachypnea
iii) Retractions  
iv) Nasal flaring  
v) Good muscle tone  
vi) Tachycardia  
vii) Head bobbing  
viii) Grunting  
ix) Cyanosis which improves with supplemental oxygen 
b) Signs and symptoms of respiratory failure  
i) Irritability or anxiety ==> lethargy  
ii) Marked tachypnea ==> bradypnea  
iii) Marked retractions ==> agonal respirations  
iv) Poor muscle tone  
v) Marked tachycardia ==> bradycardia  
vi) Central cyanosis  
c) Signs and symptoms of respiratory arrest  
i) Obtunded ==> coma  
ii) Bradypnea ==> apnea  
iii) Absent chest wall motion  
iv) Limp muscle tone  
v) Bradycardia ==> asystole  
vi) Profound cyanosis  
iv On-going assessment – improvement indicated by  
a) Improvement in color  
b) Improvement in oxygen saturation  
c) Increased pulse rate  
d) Increased level of consciousness  
d Management  
i Graded approach to treatment  
ii) Consider separating parent and child  
iii) Airway  
a) Manage upper airway obstructions as needed  
b) Insert airway adjunct if needed  
iv) Ventilation and oxygenation  
a) Respiratory distress/ early respiratory failure  
i) Administer high flow oxygen  
b) Late respiratory failure/ respiratory arrest  
i) BVM – ventilate patient with 100% oxygen via age-appropriate sized bag  
ii) ETT – intubate patient if positive pressure ventilation does not rapidly improve patient condition  
iii) Consider gastric decompression if abdominal distention is impeding ventilation  
iv) Consider needle decompression per medical direction if tension pneumothorax is present  
v) Consider cricothyroidotomy per medical direction only as a last resort if complete upper airway obstruction is present
3 Upper airway obstruction
   a Croup
      i Epidemiology
         a) Incidence
            i) Very common in infants and children (6 months to 4 years of age)
         b) Risk factors
         c) Prevention strategies
      ii Pathophysiology
         a) An inflammatory process of the upper respiratory tract involving the subglottic region
         b) Main cause is viral infection of the upper airway
         c) Another form is spasmodic croup
            i) Occurs mostly in the middle of the night
            ii) Usually without prior upper respiratory infection
      iii Assessment
         a) Signs and symptoms of respiratory distress or failure, depending on severity, plus
            i) Appears sick
            ii) Stridor
            iii) Barking (seal or dog-like) or brassy cough
            iv) Hoarseness
            v) Fever (+/-)
         b) History
            i) Usually with history of upper respiratory infection in classic croup (1-2 days)
            ii) Rarely progresses to respiratory failure
      iv Management
         a) Airway and ventilation
            i) Humidified or nebulized oxygen
            ii) Cool mist oxygen at 4-6 L/min
         b) Circulation
         c) Pharmacological
         d) Non-pharmacological
            i) Keep child in position of comfort
         e) Transport considerations
         f) Psychological support/communication strategies
            i) Do not agitate the patient (no IVs, blood pressure, etc.)
            ii) Keep the parent/guardian/caregiver with the infant or child if appropriate
b Foreign body aspiration
i Epidemiology
a) Incidence
   i) Usually occurs in toddlers and pre-schoolers (1 to 4 years of age, but can occur at any age)
   ii) Common
b) Risk factors
c) Prevention strategies
ii Pathophysiology
a) Partial or complete blockage of the upper airway by a foreign body
b) Objects are usually food (hard candy, nuts, seeds, hot dog) or small objects (coins, balloons)
c) If no interventions or if interventions are unsuccessful, respiratory arrest followed by cardiopulmonary arrest will ensue
iii Assessment
a) Partial obstruction
   i) Signs and symptoms of respiratory distress or failure, depending on severity, plus
   ii) History – Usually a history of choking if observed by adult
b) Complete obstruction
   i) Signs and symptoms of respiratory failure or arrest, depending on severity, plus
   ii) History
iv Management
a) Airway and ventilation
   i) Partial obstruction
   ii) Complete obstruction
b) Circulation
c) Pharmacological
d) Transport considerations
   i) Notify hospital of patient status
   ii) Transport expeditiously
e) Psychological support/ communication strategies
   i) Do not agitate patient
   ii) Keep caregiver with child, if appropriate

Bacterial tracheitis
i Epidemiology
a) Incidence
   i) Usually occurs in infants and toddlers (1-5 years old), but can occur in older children
   ii) Very uncommon
b) Risk factors
c) Prevention strategies
ii Pathophysiology
a) Bacterial infection of the upper airway, subglottic trachea, usually following viral croup
iii  Assessment
   a)  Signs and symptoms – respiratory distress or failure
      depending on severity, plus
      i)  Appears agitated, sick
      ii) High-grade fever
      iii) Inspiratory and expiratory stridor
      iv)  Coughing up pus/mucus
      v)  Hoarse voice
      vi)  Pain in throat
   b)  History
      i)  Usually a history of croup in the preceding few days
   c)  May progress to respiratory failure or arrest

iv  Management
   a)  Assure airway and ventilation
   b)  Administer oxygen by non-rebreather or blow-by
   c)  Complete obstruction or respiratory failure/arrest
      i)  BVM ventilation
      ii) May require high pressure to adequately ventilate
      iii) Intubate patient
      iv)  Suction endotracheal tube to reduce pus or mucus
   d)  Circulation
   e)  Pharmacological
   f)  Transport considerations
      i)  Place patient in sitting position
      ii) Notify hospital of patient status as early as possible
      iii) Transport quickly
   g)  Psychological support/communication strategies
      i)  DO NOT AGITATE THE PATIENT – no IVs, no BP, do not look in patient’s mouth
      ii) Keep caregiver with child if appropriate

d  Epiglottitis
   i  Epidemiology
      a)  Incidence
      i)  Usually occurs in pre-school and school-age children (3-7 years of age) but can occur at any age
      ii) Extremely uncommon due to the H. flu vaccine
      b)  Risk factors
      c)  Prevention strategies
   ii  Pathophysiology
      a)  Rapidly forming cellulitis of the epiglottis and its surrounding structures
      b)  Bacterial infection, usually Hemophilus influenza type B
      c)  Can be a true life-threatening emergency
Module V: Pediatrics

iii Assessment
   a) Signs and symptoms of respiratory distress or failure depending on severity, plus
      i) Appears agitated, sick
      ii) Stridor
      iii) Muffled voice
      iv) Drooling
      v) Sore throat
      vi) Pain on swallowing
      vii) High fever
   b) History
      i) Usually no previous history but a rapid onset of symptoms (6-8 hours)
   c) Can quickly progress to respiratory arrest

iv Management
   a) Airway and ventilation
      i) NEVER ATTEMPT TO VISUALIZE THE AIRWAY IF THE PATIENT IS AWAKE
      ii) Allow the parent to administer oxygen
      iii) If airway becomes obstructed, two rescuer ventilation with BVM is almost always effective
      iv) If BVM is not effective, attempt intubation with stylet in place
      v) Intubation should not be attempted in settings with short transport times
      vi) Performing chest compression upon glottic visualization during intubation may produce a bubble at the tracheal opening
      vii) Consider needle cricothyroidotomy per medical direction as a last resort if complete upper airway obstruction is present
   b) Circulation
   c) Pharmacological
   d) Transport considerations
      i) Allow patient to assume position of comfort
      ii) Notify hospital of patient status early
      iii) Transport to the hospital without delay, keeping child warm
   e) Psychological support/ communication strategies
      i) DO NOT AGITATE THE PATIENT – no IVs, BP, do not look in patient’s mouth
      ii) Keep the caregiver with the child if appropriate

4 Lower airway disease
   a) Asthma
      i) Epidemiology
         a) Incidence
Module V: Pediatrics

i) Usually occurs in children older than 2 years of age

ii) Very common

b) Risk factors

i) Typically in child with known history of asthma

ii) Triggered by upper respiratory infections, allergies, changes in temperature, physical exercise and emotional response

iii) Children that experience prolonged asthma attacks tire easily; watch for signs of respiratory failure

c) Prevention strategies

ii Pathophysiology

a) Bronchospasm

b) Excessive mucous production

c) Inflammation of the small airways

iii Assessment

a) Signs and symptoms – respiratory distress or failure depending on severity, plus

i) Appears anxious

ii) Wheezes

iii) Prolonged expiratory phase

iv) A silent chest means danger

b) History

i) Usually follows exposure to known trigger

c) Bronchiolitis and asthma may present very similarly

iv Management

a) Airway and ventilation

i) Administer oxygen by tolerated method

ii) BVM ventilations for respiratory failure/ arrest (progressive lethargy, poor muscle tone, shallow respiratory effort)

iii) Endotracheal intubation for respiratory failure/ arrest with prolonged BVM ventilations, or inadequate response to BVM ventilations

b) Circulation

c) Pharmacological

i) Albuterol nebulizer

ii) Subcutaneous epinephrine 1:1000 – only with severe respiratory distress or failure

iii) Medications can be repeated if no effect

d) Transport considerations

i) Allow patient to assume position of comfort

e) Psychological support/ communication strategies

i) Keep caregiver with child if appropriate

b Bronchiolitis

i Epidemiology
a) Incidence
   i) Usually occurs in children less than 2 years of age
   ii) Very common
b) Risk factors
   i) Usually occurs in winter months
c) Prevention strategies

ii Pathophysiology
   a) An inflammatory process of the lower respiratory tract including the terminal airways
   b) Main cause is respiratory syncytial virus infection of the lower airway

iii Assessment
   a) Signs and symptoms – respiratory distress or failure depending on severity, plus
      i) Appears anxious
      ii) Wheezing
      iii) Rales (diffuse)
   b) History
      i) Usually a history of upper respiratory infection symptoms
   c) Bronchiolitis and asthma may present very similarly

iv Management
   a) Airway and ventilation
      i) Administer oxygen by tolerated method
      ii) BVM ventilations for respiratory failure/arrest (progressive lethargy, poor muscle tone, shallow respiratory effort)
      iii) Endotracheal intubation for respiratory failure/arrest with prolonged BVM ventilations, or inadequate response to BVM ventilations
   b) Circulation
   c) Pharmacological
      i) Albuterol nebulizer
d) Transport considerations
   i) Allow patient to assume position of comfort
e) Psychological support/communication strategies
      i) Keep caregiver with child if appropriate

c Pneumonia
   i Epidemiology
      a) Incidence
         i) Usually occurs in infants, toddlers and preschoolers (1-5 years of age), but can occur at any age
         ii) Common
      b) Risk factors
      c) Prevention strategies
Pathophysiology

a) Infection of the lower airway and lung
b) May be caused by bacteria or virus

Assessment

a) Signs and symptoms – respiratory distress or failure depending on the severity, plus
i) Appears anxious
ii) Decreased breath sounds
iii) Rales
iv) Rhonchi (localized or diffuse)
v) Pain in the chest
vi) Fever

b) History
i) Usually a history of lower respiratory infectious symptoms

Management

a) Airway and ventilation
i) Administer oxygen by tolerated method
ii) BVM ventilations for respiratory failure/arrest (progressive lethargy, poor muscle tone, shallow respiratory effort)
iii) Endotracheal intubation for respiratory failure, prolonged BVM ventilations, or inadequate response to BVM ventilations

b) Circulation

c) Pharmacological

d) Transport considerations
i) Allow patient to assume position of comfort

e) Psychological support/communication strategies
i) Keep caregiver with child if appropriate

d) Foreign body lower airway obstruction

Epidemiology

a) Incidence
i) Usually occurs in toddlers and preschool age children (1-4 years of age), but can occur at any age
ii) Uncommon

b) Risk factors

c) Prevention strategies

Pathophysiology

a) Foreign body in the lower airway or lung
b) Objects are usually food (nuts, seeds, etc.) or small objects

Assessment

a) Signs and symptoms – respiratory distress or failure depending on the severity, plus
i) Appears anxious
ii) Decreased breath sounds
iii) Rales
iv) Rhonchi (localized or diffuse)

v) Pain in the chest

b) History
i) May be a history of choking if witnessed by an adult

iv Management
a) Airway and ventilation
i) Administer oxygen by tolerated method
ii) BVM ventilations for respiratory failure/arrest (progressive lethargy, poor muscle tone, shallow respiratory effort)
iii) Endotracheal intubation for respiratory failure/arrest with prolonged BVM ventilations, or inadequate response to BVM ventilations

iv) Do not attempt to retrieve foreign body as it is beyond the reach of Magill forceps

b) Circulation

c) Transport considerations
i) Allow patient to assume position of comfort

d) Psychological support/communication strategies
i) Keep caregiver with child if appropriate

B Shock
1 Introduction
a) Epidemiology
i) Incidence
ii) Morbidity/mortality
iii) Risk factors
iv) Prevention strategies

b) Categories of shock
i) Non-cardiogenic
ii) Cardiogenic

2 Pathophysiology
a) An abnormal condition characterized by inadequate delivery of oxygen and metabolic substrates to meet the metabolic demands of tissues

b) Severity
i) Compensated (early)
a) Patient’s blood pressure is normal although signs of inadequate tissue perfusion are present
b) Reversible

ii) Decompensated (late)
a) Hypotension and signs of inadequate organ perfusion are present
b) Often irreversible

c) Assessment
i) Chief complaint
ii) History
iii) Physical findings
Module V: Pediatrics

2001 EMT-Paramedic Refresher

a) Signs and symptoms of compensated shock
   i) Irritability or anxiety
   ii) Tachycardia
   iii) Tachypnea
   iv) Weak peripheral pulses, full central pulses
   v) Delayed capillary refill
   vi) Cool, pale extremities
   vii) Systolic blood pressure within normal limits
   viii) Decreased urinary output

b) Signs and symptoms of decompensated shock
   i) Lethargy or coma
   ii) Marked tachycardia or bradycardia
   iii) Marked tachypnea or bradypnea
   iv) Absent peripheral pulses, weak central pulses
   v) Markedly delayed capillary refill
   vi) Cool, pale, dusky, mottled extremities
   vii) Hypotension
   viii) Markedly decreased urinary output

d) Management
   i) Graded approach to treatment
   ii) Consider separating parent and child
   iii) Airway
      a) Trauma – immobilize c-spine
   iv) Ventilation and oxygenation
      a) Compensated shock
         i) Oxygen
      b) Decompensated shock
         i) BVM – consider ventilating patient with 100% oxygen via appropriate-sized bag
         ii) ETT – consider intubating patient if positive pressure ventilation does not rapidly improve patient’s condition
   v) Circulation
      a) Compensated shock
         i) Oxygen
      b) Decompensated shock
         i) Non-cardiogenic
         ii) Cardiogenic
   vi) Supportive care
   vii) Transport considerations
      a) Appropriate mode
      b) Appropriate facility
   viii) Psychological support/communication strategies

3 Noncardiogenic
   a) Hypovolemia
      i) Epidemiology
         a) Common
ii Pathophysiology
   a) Intravascular volume depletion
      i) Severe dehydration
      ii) Blood loss

iii Assessment
   a) Signs and symptoms of compensated or decompensated shock depending on severity, plus
      i) Blood loss
      ii) Dehydration
   b) History

iv Management
   a) Airway and ventilation
      i) Oxygen
      ii) Trauma – immobilize c-spine
   b) Circulation
      i) Compensated shock
      ii) Decompensated shock
   c) Supportive care
   d) Transport considerations
   e) Psychological support/ communication strategies

b Distributive
i Epidemiology
   a) Uncommon

ii Etiology
   a) Septic
   b) Neurogenic
   c) Anaphylactic

iii Pathophysiology
   a) Peripheral pooling due to loss of vasomotor tone

iv Assessment
   a) Signs and symptoms of compensated or decompensated shock depending on severity, plus
      i) Septic
      ii) Neurogenic
      iii) Anaphylactic
   b) History

v Management
   a) Airway and ventilation
      i) Oxygen
      ii) Trauma – immobilize c-spine
   b) Circulation
      i) Compensated shock
      ii) Decompensated shock
   c) Supportive care
   d) Transport considerations
   e) Psychological support/ communication strategies
4  Cardiogenic
   a  Cardiomyopathy
      i  Epidemiology
         a)  Infection
         b)  Congenital abnormalities
      ii  Pathophysiology
         a)  Mechanical pump failure
         b)  Usually biventricular
      iii  Assessment
         a)  Signs and symptoms of compensated or decompensated shock, depending on severity, plus
            i)  Rales
            ii)  Jugular venous distention
            iii)  Hepatomegaly
            iv)  Peripheral edema
         b)  History
      iv  Management
         a)  Airway and ventilation
            i)  Oxygen
         b)  Circulation
            i)  Compensated shock
            ii)  Decompensated shock
         c)  Supportive care
         d)  Transport considerations
         e)  Psychological support/ communication strategies
   b  Dysrhythmias
      i  Epidemiology
         a)  Bradydysrhythmias – common
         b)  Supraventricular tachydysrhythmias – uncommon
         c)  Ventricular tachydysrhythmias – very uncommon
      ii  Pathophysiology
         a)  Electrical pump failure
            i)  Results in cardiogenic shock or cardiopulmonary arrest depending on type
      iii  Assessment
         a)  Signs and symptoms of cardiogenic shock (compensated or decompensated) or cardiopulmonary arrest, depending on type
         b)  History
      iv  Management
         a)  Specific to each type

C  Dysrhythmias
   1  Tachydysrhythmias
      a  Supraventricular tachycardia
         i  Epidemiology
            a)  Incidence
               i)  Usually in infants with no prior history
            b)  Risk factors
            c)  Prevention strategies
ii Pathophysiology
a) Stable (compensated shock) – patient will usually remain stable during transport with oxygen
b) Unstable (decompensated shock) – PATIENT REQUIRES IMMEDIATE TREATMENT
c) Children may be able to sustain increased rates for a while, but after several hours, they will decompensate

iii Assessment
a) Signs and symptoms – compensated or decompensated shock, depending on severity, plus
i) Narrow complex tachycardia with rates of greater than 220 beats per minute (too fast to count)
ii) Poor feeding
iii) Hypotension

b) History

iv Management
a) Stable – supportive care
b) Unstable
i) Airway and ventilation
ii) Circulation
iii) Pharmacological
iv) Non-pharmacological
v) Transport considerations
vi) Psychological support/communication strategies

b Ventricular tachycardia with a pulse
i Epidemiology
a) Incidence
b) Risk factors
c) Prevention strategies
ii Pathophysiology
a) Stable (compensated shock) – patient will usually not tolerate for long periods of time
b) Unstable (decompensated shock) – PATIENT REQUIRES IMMEDIATE TREATMENT
c) Most VT with a pulse is secondary to structural heart disease and responds poorly to lidocaine

iii Assessment
a) Signs and symptoms – signs of compensated or decompensated shock, depending on severity, plus
i) Rapid, wide complex tachycardia
ii) Poor feeding
iii) Hypotension

b) History

iv Management
a) Stable – supportive care
b) Unstable
Bradydysrhythmias

2 Bradydysrhythmias

a Epidemiology
   i Incidence -- most common dysrhythmia in children
   ii Risk factors
   iii Prevention strategies

b Pathophysiology
   i Usually develops as a result of hypoxia
   ii May develop due to vagal stimulation (rare)

c Assessment
   i Signs and symptoms – compensated or decompensated shock, depending on severity, plus
      a) Bradycardia
      b) Slow, narrow complex heart rhythm, QRS duration may be normal or prolonged
   ii History

d Management
   i Stable – supportive care
   ii Unstable
      a) Airway and ventilation
         i) Ventilate patient with 100% oxygen via BVM
         ii) Intubate patient if poor response to BVM ventilations
      b) Circulation
         i) Perform chest compressions if oxygen does not increase heart rate
      c) Pharmacological
         i) Medications can be given down the endotracheal tube
         ii) Administer epinephrine
         iii) Administer atropine for vaguely induced bradycardia
      d) Non-pharmacological
      e) Transport considerations
      f) Psychological support/communication strategies

3 Absent rhythm

a Asystole
   i Epidemiology
      a) Incidence – may be the initial cardiac arrest rhythm
      b) Risk factors
      c) Prevention strategies
ii Pathophysiology
a) Bradycardias may degenerate into asystole
b) High mortality rate

iii Assessment
a) Signs and symptoms
   i) Pulseless
   ii) Apneic
   iii) Cardiac monitor indicating no electrical activity
b) History

iv Management
a) Confirm in two leads
b) Airway and ventilation
   i) Ventilate the patient with 100% oxygen via BVM
   ii) Intubate patient if poor response to BVM ventilations
c) Circulation
i) Perform chest compressions
d) Pharmacological
   i) Medications can be given down the endotracheal tube
   ii) Administer epinephrine
e) Non-pharmacological
f) Transport considerations
g) Psychological support/ communication strategies

b Ventricular fibrillation/ pulseless ventricular tachycardia
i Epidemiology
a) Incidence – rare
b) Risk factors
c) Prevention strategies

ii Pathophysiology
a) Possibly due to electrocution and drug overdoses
b) High mortality rate

iii Assessment
a) Signs and symptoms
   i) Pulseless
   ii) Apneic
   iii) Cardiac monitor indicating no organized electrical activity or rapid wide complex tachycardia
b) History

iv Management
a) Unmonitored – perform basic life support
b) Monitored – defibrillate up to three consecutive shocks
c) Airway and ventilation
   i) Ventilate the patient with 100% oxygen via BVM
   ii) Intubate patient if poor response to BVM ventilations
d) Circulation  
i) Perform chest compressions  

e) Pharmacological  
i) Medications can be given down the endotracheal tube  

ii) Administer epinephrine  

iii) Administer lidocaine  

iv) Administer bretylium  
v) After administration of a medication, allow it to circulate for one minute before repeat defibrillation  

f) Non-pharmacological  

g) Transport considerations  

h) Psychological support/ communication strategies  

c Pulseless electrical activity  
i Epidemiology  

a) Incidence – look for a treatable cause  

b) Risk factors  

c) Prevention strategies  

ii Pathophysiology  

a) Pneumothorax  

b) Cardiac tamponade  

c) Hypovolemia  

d) Hypoxia  

e) Acidosis  

f) Hypothermia  

g) Hypoglycemia  

iii Assessment  

a) Signs and symptoms  

i) Pulseless  

ii) Apneic  

iii) Cardiac monitor indicating organized electrical activity  

b) History  

iv Management  

a) Resuscitation should be directed toward relieving cause  

b) Airway and ventilation  

i) Ventilate the patient with 100% oxygen  

ii) Intubate patient  

c) Circulation  

i) Perform chest compressions  

d) Pharmacological  

i) Medications can be given down the endotracheal tube  

ii) Administer epinephrine  

e) Non-pharmacological  

f) Transport considerations  

g) Psychological support/ communication strategies
III Pediatric trauma

A Pathophysiology
1 Blunt
   a Thinner body wall allows forces to be readily transmitted to body contents
   b Predominant cause of injury in children

2 Penetrating
   a Becoming an increasing problem in adolescents
   b Higher incidence in the inner city (mostly intentional), but significant incidence in other areas (mostly unintentional)

B Mechanism of injury
1 Fall
   a Single most common cause of injury in children
   b Serious injury or death resulting from truly accidental falls is relatively uncommon unless from a significant height
   c Prevention strategies

2 Motor vehicle crash
   a Leading cause of permanent brain injury and new cases of epilepsy
   b Leading cause of death and serious injury in children
   c Prevention strategies

3 Pedestrian vehicle crash
   a Particularly lethal form of trauma in children
   b Initial injury due to impact with vehicle (extremity/trunk)
   c Child is thrown from force of impact causing additional injury (head/spine) upon impact with other objects (ground, another vehicle, light standard, etc.)
   d Prevention strategies

4 Near-drowning
   a Third leading cause of injury or death in children between birth and 4 years of age
   b Causes approximately 2000 deaths annually
   c Severe, permanent brain damage occurs in 5-20% of hospitalized children for near drowning
   d Prevention strategies

5 Penetrating injuries
   a Risk of death from firearm injuries increase with age
   b Stab wounds and firearm injuries account for approximately 10-15% of all pediatric trauma admissions
   c Visual inspection of external injuries can not evaluate the extent of internal involvement
   d Prevention strategies

6 Burns
   a The leading cause of accidental death in the home for children under the age of 14 years
   b Burn survival is a function of burn size and concomitant injuries
      i Modified “rule of nines” is utilized to determine percentage of surface area involved
   c Prevention strategies
7 Physical abuse
   a Has been classified into four categories – physical abuse, sexual abuse, emotional abuse and child neglect
   b Social phenomena such as increased poverty, domestic disturbance, younger aged parents, substance abuse, and community violence have been attributed to increase of abuse
   c Document all pertinent findings, treatments and interventions
d Prevention strategies

C Special considerations
1 Airway control
   a Maintain in-line stabilization in neutral, not sniffing position
   b Administer 100% oxygen to all trauma patients
   c Patent airway must be maintained via suctioning and jaw thrust
   d Be prepared to assist ineffective respirations
   e Intubation should be performed when the airway remains inadequate
   f Gastric tube should be placed after intubation
   g Needle cricothyroidotomy is rarely indicated for traumatic upper airway obstruction

2 Immobilization
   a Indications for stabilization and immobilization of cervical spine
   b Utilize appropriate sized pediatric immobilization equipment
      i Rigid cervical collar
      ii Towel/ blanket roll
      iii Child safety seat
      iv Pediatric immobilization device
      v Vest-type/ short wooden backboard
      vi Long backboard
      vii Straps, cravats
      viii Tape
      ix Padding
   c Maintain supine neutral in-line position for infants, toddlers, and preschoolers by placing padding from the shoulders to the hips

3 Fluid management
   a Management of the airway and breathing take priority over management of circulation because circulatory compromise is less common in children than adults
   b Vascular access
      i Large-bore intravenous catheter should be inserted into a large peripheral vein
      ii Do not delay transport to gain access
      iii Intraosseous access in children < 6 years of age if intravenous access fails
      iv Initial fluid bolus of 20 ml/kg of an lactated ringers or NS
      v Reassess vital signs and rebolus with 20 ml/kg if no improvement
      vi If improvement does not occur after the second bolus, there is likely to be significant blood loss and the need for rapid surgical intervention
4 Traumatic brain injury
   a Early recognition and aggressive management can reduce mortality and morbidity
   b Severity
      i Mild – GCS is 13 to 15
      ii Moderate – GCS is 9 to 12
      iii Severe – GCS is less than or equal to 8
   c Signs of increased intracranial pressure
      i Elevated blood pressure
      ii Bradycardia
         a) Rapid deep respirations (Kussmaul) progressing to slow, deep respirations alternating with rapid deep respirations (Cheyne-Stokes)
      iii Bulging fontanelle (infant)
   d Signs of herniation
      i Asymmetrical pupils
      ii Posturing
   e Specific management
      i Administer high concentration of oxygen for mild to moderate head injuries (GCS 9-15)
      ii Intubate and ventilate at normal breathing rate with 100% oxygen for severe head injuries (GCS 3-8)
         a) Use of lidocaine may blunt rise in ICP (controversial)
         b) Consider RSI per medical direction
      iii Indications for hyperventilation
         a) Asymmetric pupils
         b) Active seizures
         c) Neurologic posturing
D Specific injuries
1 Head and neck injury
   a Larger relative mass of the head and lack of neck muscle strength provides increased momentum in acceleration-deceleration injuries and a greater stress to the cervical spine region
   b Fulcrum of cervical mobility in the younger child is at the C2-C3 level
   c 60% to 70% of pediatric fractures occur in C1 or C2
   d Head injury is the most common cause of death in pediatric trauma victim
   e Diffuse injuries are common in children, focal injuries are rare
   f Soft tissues, skull and brain are more compliant in children than in adults
      i Due to open fontanelles and sutures, infants up to an average age of 16 months may be more tolerant to an increase of intracranial pressure and can have delayed signs
   g Subdural bleeds in an infant can produce hypotension (extremely rare)
   h Significant blood loss can occur through scalp lacerations and should be controlled immediately
   i The Modified Glasgow Coma scale should be utilized for infants and young children
2 Chest injury
a Chest injuries in children under 14 years of age are usually the result of blunt trauma
b Due to the compliance of the chest wall, severe intrathoracic injury can be present without signs of external injury
c Tension pneumothorax is poorly tolerated and is an immediate threat to life
d Flail segment is an uncommon injury in children; when noted without a significant mechanism of injury, suspect child abuse
e Many children with cardiac tamponade will have no physical signs of tamponade other than hypotension

3 Abdominal injury
a Musculature is minimal and poorly protects the viscera
b Organs most commonly injured are liver, kidney and spleen
c Onset of symptoms may be rapid or gradual
d Due to the small size of the abdomen, be certain to palpate only one quadrant at a time
i Any child who is hemodynamically unstable without evidence of obvious source of blood loss should be considered as having an abdominal injury until proven otherwise

4 Extremity
a Relatively more common in children than adults
b Growth plate injuries are common
c Compartment syndrome is an emergency in children
d Any sites of active bleeding must be controlled
e Splinting should be performed to prevent further injury and blood loss
f PASG may be useful in unstable pelvic fractures with hypotension

5 Burns
a Thermal burns in children
b Chemical burns in children
c Electrical burns in children
d Management priorities
i Prompt management of the airway is required as swelling can develop rapidly
ii If intubation is required, an endotracheal tube up to two sizes smaller than what would normally be used may be required
iii Thermally burned children are very susceptible to hypothermia; maintain normal body temperature
Module VI:
Other Recommended Content Areas
Operations

NREMT PRACTICE ANALYSIS TASK ITEMS
- Prepare the emergency vehicle and equipment before responding to a call
- Drive the emergency vehicle in an emergency situation
- Assess scene safety
- Provide for safety of self, patient and fellow workers
- Take infection control precautions (body substance isolation), Dispose of sharps (needles, auto-injector, etc...), Dispose of materials contaminated with body fluids
- Use body mechanics when lifting and moving a patient

COGNITIVE OBJECTIVES
At the completion of this unit, the paramedic will be able to:

6.1 Discuss the importance of completing an ambulance equipment/ supply checklist. (C-1)
6.2 Given a scenario involving arrival at the scene of a motor vehicle collision, assess the safety of the scene and propose ways to make the scene safer. (C-3) / 1-2.11
6.3 List factors that contribute to safe vehicle operations. (C-1) / 1-2.12
6.4 Describe the considerations that should be given to: (C-1) / 1-2.13
   a. Using escorts
   b. Adverse environmental conditions
   c. Using lights and siren
   d. Proceeding through intersections
   e. Parking at an emergency scene
6.5 Discuss the concept of "due regard for the safety of all others" while operating an emergency vehicle. (C-1) / 1-2.14
6.6 Explain how EMS providers are often mistaken for the police. (C-1) / 8-5.1
6.7 Explain specific techniques for risk reduction when approaching the following types of routine EMS scenes: (C-1) / 8-5.2
   a. Highway encounters
   b. Violent street incidents
   c. Residences and "dark houses"
6.8 Describe warning signs of potentially violent situations. (C-1) / 8-5.3
6.9 Explain emergency evasive techniques for potentially violent situations, including: (C-1) / 8-5.4
   a. Threats of physical violence.
   b. Firearms encounters
   c. Edged weapon encounters
6.10 Explain EMS considerations for the following types of violent or potentially violent situations: (C-1) / 8-5.5
   a. Gangs and gang violence
   b. Hostage/ sniper situations
   c. Clandestine drug labs
   d. Domestic violence
   e. Emotionally disturbed people
   f. Hostage/ sniper situations
6.11 Explain the following techniques: (C-1) / 8-5.6
   a. Field "contact and cover" procedures during assessment and care
   b. Evasive tactics
   c. Concealment techniques

6.12 Describe police evidence considerations and techniques to assist in evidence preservation. (C-1) 8-5.7

6.13 Describe the problems that a paramedic might encounter in a hostile situation and the techniques used to manage the situation. (C-1) / 1-2.10

6.14 Describe the equipment available for self-protection when confronted with a variety of adverse situations. (C-1) / 1-2.15

6.15 Differentiate proper from improper body mechanics for lifting and moving patients in emergency and non-emergency situations. (C-3) / 1-2.9

**AFFECTIVE OBJECTIVES**

At the completion of this unit, the paramedic will be able to:

6.16 Assess personal practices relative to ambulance operations, which may affect the safety of the crew, the patient and bystanders. (A-3) / 8-1.6

6.17 Serve as a role model for others relative to the operation of ambulances. (A-3) / 8-1.7

6.18 Advocate and practice the use of personal safety precautions in all scene situations. (A-3) / 1-2.43

6.19 Discuss the importance of universal precautions and body substance isolation practices. (C-1) / 1-2.30

6.20 Describe the steps to take for personal protection from airborne and bloodborne pathogens. (C-1) / 1-2.31

6.21 Given a scenario, in which equipment and supplies have been exposed to body substances, plan for the proper cleaning, disinfection, and disposal of the items. (C-3) / 1-2.32

6.22 Explain what is meant by an exposure and describe principles for management. (C-1) / 1-2.33

6.23 Advocate and serve as a role model for other EMS providers relative to body substance isolation practices. (A-3) 1-2.43

**PSYCHOMOTOR OBJECTIVES**

At the completion of this unit, the paramedic will be able to:

6.24 Demonstrate the following techniques: (P-1) / 8-5.8
   a. Field “contact and cover” procedures during assessment and care
   b. Evasive tactics
   c. Concealment techniques

6.25 Demonstrate the proper procedures to take for personal protection from disease. (P-2) / 1-2.46

6.26 Demonstrate safe methods for lifting and moving patients in emergency and non-emergency situations. (P-2) / 1-2.45

6.27 Demonstrate how to place a patient in, and remove a patient from, an ambulance. (P-1) / 8-1.9
Other Suggested Topic Areas

1. Diagnostic ECG
2. EMS Agenda for the Future issues (such as prevention)
3. Geriatrics
4. Local clinical & technology / equipment update
5. Local quality improvement issues
6. Nationally recognized guidelines / programs for out-of-hospital care (ACLS, AMLS, BTLS, PALS, PEPP, PHTLS, etc)
7. Skills updates / maintenance
Appendix A

NREMT Practice Analysis (1999)
**NREMT Practice Analysis (1999)**

Below is a list of the tasks extracted from the 1999 NREMT Practice Analysis. Each participant involved in the random survey was asked to indicate the frequency in which they utilized an identified task. In addition to frequency, the participants were asked to provide input on the potential of harm and difficulty they experienced in accomplishing each task. The chart below identifies those task, based on either frequency and/or potential for harm, that was used in the creation of this document. The task force utilized those task that were identified as having low frequency of performance and a high potential for harm along with the tasks that had a high frequency of performance and a high potential for harm. 24 of the 123 tasks were identified as meeting the above criteria and were utilized as the basis for the mandatory portion of this refresher curriculum.

Practice Scenario and Scenario Template

**Scenario Template**

Lectures have traditionally been the backbone for most educational endeavors. While this type of education process has been used in the past, today’s students are seeking greater challenges in the classroom. One alternative method for education is the use of scenario based education. Scenario based education allows the instructor and student to achieve a more realistic approach to patient care situations. This refresher curriculum can be delivered to the experienced provider through the use of scenarios.

This scenario template has been included for use during the refresher course. The template was designed by the NREMT for use with their oral scenario station. The recommendation would be for the instructor to develop scenarios that met the objectives of this curriculum for use in the classroom portion as well as the skill labs.

### MANDATORY ACTIONS

Rapid identification of life-threat and immediate transportation to the emergency department
High flow oxygen

### POTENTIALLY HARMFUL/DANGEROUS ACTIONS ORDERED/PERFORMED

Delayed transportation for on scene interventions
Taking the patient to the doctor’s office
BACKGROUND & DISPATCH INFORMATION

You are a paramedic on a transporting paramedic unit. You are working with a paramedic partner in a suburban EMS system. You are thirty (30) minutes away from the attending physician’s office and fifteen (15) minutes from the community hospital.

At 1512 hours, you are dispatched to a residence for a non-emergent transport of a woman to her doctor’s office. It is a clear spring day with temperature of 68°F. A woman who identifies herself as the patient’s daughter meets you at the door.
Appendix C

Practical Evaluation Skill Sheets

(Modeled after the NREMT Practical Skill Sheets)
The practical skill sheets included in this appendix were modeled after the National Registry of Emergency Medical Technicians’ (NREMT) Advanced Level Practical Examination for the 1998 EMT-Paramedic National Standard Curriculum. These skill sheets should not be used as a substitute during a NREMT Advanced Level Practical Examination. The sheets were designed to be used as a standarized evaluation instrument for determining an individual’s competency for an identified psychomotor skill.

</table>

**CRITICAL CRITERIA**

- Failure to initiate or call for transport of the patient within 10 minute time limit
- Failure to take or verbalize body substance isolation precautions
- Failure to determine scene safety
- Failure to assess for and provide spinal protection when indicated
- Failure to voice and ultimately provide high concentration of oxygen
- Failure to assess/provide adequate ventilation
- Failure to find or appropriately manage problems associated with airway, breathing, hemorhage or shock [hypoperfusion]
- Failure to differentiate patient’s need for immediate transportation versus continued assessment/treatment at the scene
- Does other detailed/focused history or physical exam before assessing/treating threats to airway, breathing, and circulation
- Orders a dangerous or inappropriate intervention

You must factually document your rationale for checking any of the above critical items on the reverse side of this form.

</table>

Total 27

**CRITICAL CRITERIA**

- Failure to initiate ventilations within 30 seconds after applying gloves or interrupts ventilations for greater than 30 seconds at any time
- Failure to take or verbalize body substance isolation precautions
- Failure to voice and ultimately provide high oxygen concentration [at least 85%]
- Failure to ventilate patient at a rate of at least 10/minute
- Failure to provide adequate volumes per breath [maximum 2 errors/minute permissible]
- Failure to pre-oxygenate patient prior to intubation and suctioning
- Failure to successfully intubate within 3 attempts
- Failure to disconnect syringe immediately after inflating cuff of ET tube
- Uses teeth as a fulcrum
- Failure to assure proper tube placement by auscultation bilaterally and over the epigastrium
- If used, stylet extends beyond end of ET tube
- Inserts any adjunct in a manner dangerous to the patient
- Suctions the patient for more than 15 seconds
- Does not suction the patient

You must factually document your rational for checking any of the above critical items on the reverse side of this form.

| Interacted and responded appropriately with patient, crew, and bystanders | 2 |
| Used inappropriate communication techniques | 1 |
| Demonstrated intolerance for patient, bystanders, and crew | 0 |

**Integration (verbal report, field impression, and transport decision)**

| Stated correct field impression and pathophysiology basis, provided succinct and accurate verbal report including social/psychological concerns, and considered alternate transport destinations | 3 |
| Stated correct field impression, provided succinct and accurate verbal report, and appropriately stated transport decision | 2 |
| Stated correct field impression, provided inappropriate verbal report or transport decision | 1 |
| Stated incorrect field impression or did not provide verbal report | 0 |

| Time end: | Total | 15 |

**CRITICAL CRITERIA**

---

Failure to appropriately address any of the Scenario’s “Mandatory Actions”

Performs or orders any harmful or dangerous action or intervention

You must factually document your rational for checking any of the above critical items on the reverse side of this form.
Intravenous Therapy

Candidate: ___________________________  Examiner: ___________________________

Date: ___________________________  Signature: ___________________________

| Selects appropriate catheter | 1               |                |
| Selects proper administration set | 1 |                |
| Connects IV tubing to the bag | 1 |                |
| Prepares administration set [fills drip chamber and flushes tubing] | 1 |                |
| Cuts or tears tape [at any time before venipuncture] | 1 |                |
| Takes/verbalizes body substance isolation precautions [prior to venipuncture] | 1 |                |
| Applies tourniquet | 1 |                |
| Palpates suitable vein | 1 |                |
| Performs venipuncture | 5 |                |
| - Inserts stylet (1 point) | |                |
| - Notes or verbalizes flashback (1 point) | |                |
| - Occludes vein proximal to catheter (1 point) | |                |
| - Removes stylet (1 point) | |                |
| - Connects IV tubing to catheter (1 point) | |                |
| Disposes/verbalizes disposal of needle in proper container | 1 |                |
| Releases tourniquet | 1 |                |
| Runs IV for a brief period to assure patent line | 1 |                |
| Secures catheter [tapes securely or verbalizes] | 1 |                |
| Adjusts flow rate as appropriate | 1 |                |

Time end: ___________________________  Total: 21

CRITICAL CRITERIA

- Failure to establish a patent and properly adjusted IV within 6 minute time limit
- Failure to take or verbalize body substance isolation precautions prior to performing venipuncture
- Contaminates equipment or site without appropriately correcting situation
- Performs any improper technique resulting in the potential for uncontrolled hemorrhage, catheter shear, or air embolism
- Failure to successfully establish IV within 3 attempts during 6 minute time limit
- Failure to dispose/verbalize disposal of needle in proper container

Note: Check here (_____) if candidate did not establish a patent IV and do not evaluate IV Bolus Medications

Intravenous Bolus Medications

Time start: ___________________________  Possible Points  Points Awarded

| Asks patient for known allergies | 1               |                |
| Selects correct medication       | 1               |                |
| Assures correct concentration of drug | 1 |                |
| Assembles prefilled syringe correctly and dispels air | 1 |                |
| Continues body substance isolation precautions | 1 |                |
| Cleanses injection sit [Y-port or hub] | 1 |                |
| Reaffirms medication            | 1               |                |
| Stops IV flow [punches tubing or shuts off] | 1 |                |
| Administers correct dose at proper push rate | 1 |                |
| Disposes/verbalizes proper disposal of syringe and needle in proper container | 1 |                |
| Flushes tubing [runs wide open for a brief period] | 1 |                |
| Adjusts drip rate to TKO/KVO      | 1               |                |
| Verbalizes need to observe patient for desired effect/adverse side effects | 1 |                |

Time end: ___________________________  Total: 13

CRITICAL CRITERIA

- Failure to begin administration of medication within 3 minute time limit
- Contaminates equipment or site without appropriately correcting situation
- Failure to adequately dispel air resulting in potential for air embolism
- Injects improper drug or dosage [wrong drug, incorrect amount, or pushes at inappropriate rate]
- Failure to flush IV tubing after injecting medication
- Recaps needle or failure to dispose/verbalize disposal of syringe and needle in proper container

You must factually document your rationale for checking any of the above critical items on the reverse side of this form.
Modeled after the National Registry of Emergency Medical Technicians Advanced Level Practical Examination

Pediatric (<2 yrs.) Ventilatory Management

Candidate: _______________________________ Examiner: _______________________________

Date: _______________________________ Signature: _______________________________

NOTE: If candidate elects to ventilate initially with BVM attached to reservoir and oxygen, full credit must be awarded for steps denoted by “*” so long as first ventilation is delivered within 30 seconds

<table>
<thead>
<tr>
<th>Possible Points</th>
<th>Points Awarded</th>

<tr>
<td>Secures ET tube (may be verbalized)</td>
<td>1</td>
</tr>
</tbody>
</table>

Total 17

**CRITICAL CRITERIA**

- Failure to initiate ventilations within 30 seconds after applying gloves or interrupts ventilations for greater than 30 seconds at any time
- Failure to take or verbalize body substance isolation precautions
- Failure to pad under the torso to allow neutral head position or sniffing position
- Failure to voice and ultimately provide high oxygen concentration [at least 85%]
- Failure to ventilate patient at a rate of at least 20/minute
- Failure to provide adequate volumes per breath [maximum 2 errors/minute permissible]
- Failure to pre-oxygenate patient prior to intubation
- Failure to successfully intubate within 3 attempts
- Uses teeth as a fulcrum
- Failure to assure proper tube placement by auscultation bilaterally and over the epigastrium
- Inserts any adjunct in a manner dangerous to the patient
- Attempts to use any equipment not appropriate for the pediatric patient

*You must factually document your rational for checking any of the above critical items on the reverse side of this form.*

<td>Slowly injects saline to assure proper placement of needle</td>
<td>1</td>
<td></td>
</tr>
<tr>
<td>Connects administration set and adjusts flow rate as appropriate</td>
<td>1</td>
<td></td>
</tr>
<tr>
<td>Secures needle with tape and supports with bulky dressing</td>
<td>1</td>
<td></td>
</tr>
</tbody>
</table>

**Time end:** ____________

**Total** 23

**CRITICAL CRITERIA**

- Failure to establish a patent and properly adjusted IO within 6 minute time limit
- Failure to take or verbalize body substance isolation precautions prior to performing IO puncture
- Contaminates equipment or site without appropriately correcting situation
- Performs any improper technique resulting in the potential for air embolism
- Failure to assure correct needle placement before attaching administration set
- Failure to successfully establish IO infusion within 2 attempts during 6 minute time limit
- Performing IO puncture in an unacceptable manner [improper site, incorrect needle angle, etc.]
- Failure to dispose of needle in proper container
- Orders or performs any dangerous or potentially harmful procedure

You must factually document your rational for checking any of the above critical items on the reverse side of this form.
Spinal Immobilization (Seated Patient)

Candidate: ______________________ Examiner: ______________________

Date: ______________________ Signature: ______________________

<table>
<thead>
<tr>
<th>Time start: _______________</th>
<th>Possible Points</th>
<th>Points Awarded</th>
</tr>
</thead>
<tbody>
<tr>
<td>Takes or verbalizes body substance isolation precautions</td>
<td>1</td>
<td></td>
</tr>
<tr>
<td>Directs assistant to place/maintain head in the neutral, in-line position</td>
<td>1</td>
<td></td>
</tr>
<tr>
<td>Directs assistant to maintain manual immobilization of the head</td>
<td>1</td>
<td></td>
</tr>
<tr>
<td>Reassesses motor, sensory, and circulation function in each extremity</td>
<td>1</td>
<td></td>
</tr>
<tr>
<td>Applies appropriately sized extrication collar</td>
<td>1</td>
<td></td>
</tr>
<tr>
<td>Positions the immobilization device behind the patient</td>
<td>1</td>

<tr>
<td>Reassesses motor, sensory, and circulation function in each extremity</td>
<td>1</td>
<td></td>
</tr>
</tbody>
</table>

Time end: _______________ Total 12

CRITICAL CRITERIA

— Did not immediately direct or take manual immobilization of the head
— Did not properly apply appropriately sized cervical collar before ordering release of manual immobilization
— Released or ordered release of manual immobilization before it was maintained mechanically
— Manipulated or moved patient excessively causing potential spinal compromise
— Head immobilized to the device before device sufficiently secured to torso
— Device moves excessively up, down, left, or right on the patient’s torso
— Head immobilization allows for excessive movement
— Torso fixation inhibits chest rise, resulting in respiratory compromise
— Upon completion of immobilization, head is not in a neutral, in-line position
— Did not reassess motor, sensory, and circulation functions in each extremity after voicing immobilization to the long backboard

You must factually document your rational for checking any of the above critical items on the reverse side of this form.
**Spinal Immobilization (Supine Patient)**

Candidate: ___________________________  Examiner: ___________________________
