Should you be tested for Hepatitis C?

Why should you be tested for Hepatitis C?

There are things you can do to fight hepatitis C. Early detection can help. Knowing your hep C status will help prevent transmission to others. Hep C is a curable condition for most people. Better treatments are available with fewer side effects. Even if you do not start treatment, there are a few things you can still do to keep your liver healthy, such as avoiding alcohol and getting vaccinated for hepatitis A and B.

What is Hepatitis C?

Hepatitis C (Hep C) is a liver disease caused by the hepatitis C virus. Hepatitis C can lead to serious liver damage. Hepatitis C progresses slowly and often has no symptoms. Many people have hepatitis C and don’t know it. The only way to know if you have hepatitis C is to get tested.

Get tested for hepatitis C if you…

- Injected drugs, even just once many years ago
- Were born from 1945-1965 (Baby Boomers)*
- Received donated blood or organs before 1992
- Received clotting factor before 1987
- Got a tattoo or body piercing from an unlicensed artist, such as on the street or while in jail
- Are HIV positive
- Were exposed to blood on the job through a needlestick or injury with a sharp object
- Were ever on long-term dialysis
- Snorted drugs

* In New York State, health care providers are required by law to offer anyone born between 1945 and 1965 a test for hepatitis C.
A Hepatitis C Antibody Test is a blood test that looks for antibodies to the hepatitis C virus. The test can be done by collecting a blood sample and sending it to a lab, or by a fingerstick using a hepatitis C rapid antibody test. The hepatitis C antibody test will tell you if you have ever been infected with hepatitis C. You may need a second test to know if you are currently infected.

**Hepatitis C Antibody Test Results**

**If the test result is NON-REACTIVE/NEGATIVE**

- A non-reactive or negative antibody test means that you are not currently infected with the hepatitis C virus.
- However, if you have engaged in risky behavior in the last 6 months, you will need to be tested again.
- Your non-reactive test result does not protect you from getting hepatitis C in the future.

**If the test result is REACTIVE/POSITIVE**

- A reactive or positive antibody test means that you have antibodies to hepatitis C in your blood.
- You were exposed to hepatitis C at one time. You are probably infected with hepatitis C.
- You will need a second test to know for sure.

**Take the Second Test. Know for Sure.**

- This second test is called an RNA test. Another name used for this test is a PCR test. The RNA test checks for hepatitis C virus in your blood.
- If you don’t have the virus in your blood, this test will come back undetectable. If the test comes back detectable, then you have hepatitis C.
