Colorectal cancer is the fourth most common cancer in New York State (NYS) and the second leading cause of cancer deaths. Regular screening is key to preventing colorectal cancer or finding it early when it may be easier to treat. In 2019, over 70% of NYS adults ages 50 to 75 years old reported being up to date with colorectal cancer screening, but screening rates varied by age group.1

Colorectal cancer screening rates were lowest among NYS adults ages 50 to 54 years old.

Among adults ages 50 to 54 years old, colorectal cancer screening rates were lowest for men, those with lower annual household incomes, those without health insurance, and those without a personal health care provider.

Public Health Opportunity
Colorectal cancer screening rates among adults 50 to 54 years old are significantly lower than screening rates for older adults. Some studies have shown that patients under the age of 55 are more likely to be diagnosed with late-stage cancer than their older counterparts.2 Recent changes to the U.S. Preventive Services Task Force CRC screening guidelines lowered the recommended age for average-risk adults to start screening to 45 years old. Health care providers have an important opportunity to encourage these life-saving screenings by:

- Talking to patients about colorectal cancer screening before age 45 to prepare them to start screening on time and discussing screening at every patient encounter and not just at yearly check-ups.
- Reviewing family history, risk status, and screening test options at an early age to identify the right test for each patient.
- Using evidence-based interventions to increase community demand for, and access to, cancer screening.
- Strengthening messages and customizing health information and small media to specific patient populations.
